Hi Guys,

I'm looking for some Codan 8422 sell call units with below series issue 8. The issue number is written or printed on the Eprom. Anyone got any spare units they want to get rid off???
Reagds,

Mlacolm

Hi Daniel,

According to the service manual the 7727T/TB/C will go up to 16mHz but above 11 mHz you will need the 44-70074 coil type. The difference is probably in the number of windings in the coil. Could be worth trying something around 180 pf tuning cap. With a short tap.

Hi,

Can anyone tell me what the frequency coverage is in a 7727-T and a 7727-C. I am considering doing one up for VKS737 but i would like to know if it will make it up to 14977Khz before i order the crystals.

Thanks
Daniel

If that coil is one of the purple ones I have some somewhere. May need some replacement slugs. In fact if anyone can tell me a source of slugs for the 6801 mk2 coild I'd be very happy.
Cheers
Jim

Thanks everyone for your help, if i find the time i may tinker with
a few coils myself, i have rewound those small coil/transformers
before for amateur stuff. Someone should put all the specs and info
on these old models on the web, i would if i knew it all.
Could anyone provide a copy of the service manual? I tried codan but
i think the guy would have fallen off his chair laughing when he read
it, too old they said.

Thanks,
Daniel

1562. Wagner

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-07-06 06:34:35 UTC
From: Ian
Topic: 1562 Message: 1562

Hi,

Does anybody have any data on an ancient Wagner Model C1-25 Mk 5A radio? It is an 8 channel set, mine has 7 RFDS frequencies fitted. I am interfacing a tone call circuit to it, and would be interested in a circuit diagram. It seems to work OK, but I'm getting some interesting effects from interference from the clock on the PIC chip I'm using.

Cheers,

Ian

1563. VCO unlock problem with 8525A

Yahoo group: codan_outback_radio (1997 — 2004)

From: Brett Dawson
Topic: 1563 Message: 1563

Hi all,

I have a 8525A which has a VCO (VCO2) that seems to want to become unlocked from time to time. Also, both VCO's seem to be somewhat microphonic.

Can anyone help with common VCO faults?

Also, output power is low at 65W. Aside from the power set resistor, is there an alignment process to peak RF power to 100W?

Thanks

Brett

1564. Circuit diagram for 8525A Codan radio

From: vk8n
Topic: 1565 Message: 1565

G'day all.

Has any one ever attempted to rewind a Tapped whip. I have now a collection of whips but all have frequencies which are of no use to me. Some are close, 50 khz off but not all the frequencies are on the one whip so I would have to carry 2 or 3.

If anyone could shed some light on this, even just to say I am an idiot if I try, I would be much appreciated.

Regards

R-J

1566. Re: [codan_outback_radio] Taped whip Aerials

Yahoo group: codan_outback_radio (1997 — 2004)

From: Matt
Topic: 1565 Message: 1566

A friend has done the rebuild of a tapped whip. It did work, but he had to spend a lot of time getting the taps in the right places.
What he did was remove the external coating, desolder the taps he wanted to move, and then once he had the tap in the right place (bugger of a job apparently), reattatched the tap and then used some sort of waterproofing material on the outside.
Not to sure how long this method would last, as he bought himself an auto tune antenna not long after he did the retapping - it now sits somewhere in his radio junk pile I think.
Personally I am not convinced that the antenna would last all that long, particularly in the more extreme areas (from your email address I figure you are out Arnhem land way, so I guess your area would qualify for this description). Maybe if you really went overboard in waterproofing it, then it would be OK, but I personally wouldn't trust my safety and well being to it - a custom made 21 tap whip (specify whatever freqs you want) used to cost somewhere in the $400 area - or a second hand 8558 auto tune for not much more would be a much better investment.
Mind you, I always have bits and pieces in the car to string up an emergency dipole in the event that I need it (i.e. auto tune breaks and I need help - if you roll your car, then I guess that the auto tune antenna is the most likely to be damaged). They can be made up with a bit of coax, and a couple of lengths of wire soldered to the coax - I keep a spare gas soldering iron in the toolbox - and work better than a whip, mind you not really practical to have one draped over the car when you are driving around.
Hope this helps you out.

Matt

From: vk8n
Topic: 1568 Message: 1568

Ok Jim

You got me, I have no Idea what or how to make a "linear wound whip".
I dont mind spending 5-6 hrs rewinding but if there is an easier way
I'll take it. I have spent some times weeks making aerials only to
find some one did it alot easier, ask me about my 2.4 gig wireless
network some day.

So again Jim can you help me? "Big Please"

What do I need to do to make a "linear wound whip".

R-J

Topic: 1568 Message: 1569

Hi RJ, I was referring to the taper of the whip. If the diameter of the whip is constant and the tpi are constant I refer to it as a "linear wound whip". Probably erroniously but I do it anyway. Obviously with a fibreglassed "Terlin" type whip the od changes and so to my mind its not linear.
Cheers
Jim

After being told that there is no such beastie, I now know of one for sale. Unfortunately it's to licensed amateurs only, sorry guys. Any licensed amateurs looking for such a beast that doesn't exist can email me. Apart from that I know NOTHEEENG :))

Jim

The above mailing did not happen. If you received this email in error then it doesn't exist. In which case no correspondance can be entered into about the contents of such email as it never happened. The author believes that the above situation is due to too many broken coils and slugs in 6801's. Normal transmission will resume shortly.

1572. Re-tapping whips(long)

Yahoo group: codan_outback_radio (1997 — 2004)

Topic: 1572 Message: 1572

Re-tapping whips is not a great pastime but for the sake of you whip suiciders out there I'll see if I can help :)
This is 1 way, if you know of an easier/better way please let us all know.
You may need some "sacrificial" whips to perfect the technique...I still have the 3 I stuffed before getting a 1/2 decent product.
First check the lowest frequency on the whip. Remember that you are not only looking for the resonant frequency but also a decent matching impedance.(and bandwidth). Once you know the bottom frequency the it's filing off the fibreglass time. Do the lowest frequencies through to the highest frequencies, checking for resonance, bandwidth and Z as you go. A tranceiver may be used with an swr meter if nothing else is handy. Take your time, and remember that this will a matter of suck it and see. When you have the tap points suitably selected, get some banana sockets and solder them to each tap. Re check each tap on the tranceiver with the whip mounted on a vehicle etc. Remember these taps can be very finniky, a turn either way and its off. (worse at higher frequencies of course). Remember that the pitch of the winding is also a factor, basically for a given frequency the longer the radiator the better....so while a tap for 27meg within 5 cm of the end of the whip might seem to work with the instruments, it aint gonna be great !
Now for the good bits. Grab some 5 minute epoxy and go over the bits you've filed off , to weatherproof it Get some Selleys steel knead it (in a tube) and mix, then mould to an appropriate shape around the banana socket. Mark the freq on the tap using some "whiteout" after you've sprayed the whip with a non metallic paint. An alternative is to use black heatshrink over the banana sockets...hole drilled of course.
Re check the frequencies with your swr/low powered tx mounted on the final resting place.. This might be the disappointing bit, frequencies may have moved. External shorted turns ie a loop of wire can be shifted up and down the whip for small tuning and bandwidth adjustments.
Success will obviously be the result of my "brilliant" help. I'd rather not know about the failures :)))Good Luck.
Jim

I saw a message yesterday come up about the 8528 programming having to be done by burning the eprom. You may be right, but Ill quote you from the 8528 brochure printed by Codan. Quote. Under "8528 Features and Benifits" "Programable" Depending on the option selected, recieve only or transmit and recieve frequencies can be programmed from the tranciever front panel. End of quote.
The one that was in eBay had pre programmed channels plus a group that could be changed manually?????
Regards,
Malcolm

Hi Malcolm - yes the 8528 has the capacity to program 100 channels via the radios front panel. A mod needs to be performed (soldering one solder bridge), and a particular version of the software (cannot remember which option software it is) needs to be burn't to the eprom. Once done, you can enter any Tx/Rx freq that you want to the P channels (99 channels) - the other 500 channels need to be burnt to the eprom.

Thanks for that. Now all I need to do is find one with an auto antenna, have the correct channels burnt for what I need over here and get it here :-))
Can you tell me how much one could expect to buy a new Codan auto antenna for over there??
One that doesn't need a board fitted to the radio and is self driven.

The 8558 AT needs the board - currently you can get the AT for about $400-$500. The one which doesn't need the board (built into it) is the current variant - one that goes with the 9323, and costs a bit more - have seen them secondhand from about the $600 upwards. This antenna is the better one to have as it tunes a lot quicker than the 8558 does - I always on the lookout for a well priced one myself as it irritates me when my tuner takes so long.
Possibly you could contact a comms shop here in Aust and get them to email the file (.DAT from memory) that needs to be burn't to the eprom (you would need to supply them with the freqs of course) - and then you could get an eprom burnt locally at your end. Alternatively there are probably people here on this group that have the software who could do the same thing for you. The chip is extremely common - from memory there are heaps of them found in the older radios, and I am pretty certain that you can still buy them.

Hi Matt,

Thanks for that. I have a number of 8727, 7727C, T & TB's at the moment. They are not a problem but I have a few more things I want to be able to in my mobile and the 7727TB is just not cutting it at present. Crystals and antenna taps are a pain in the rear end at times. :-)). Especially when you want to add something new.
We don't see the 85 and later series radios over here second-hand very often as the use of HF is in the decline. Well for some anyway. Mostly 77 and 87 series. hence I need to find one over there and import it here. There is only one Codan agent in NZ and they don't give anything away or do anything for nothing.
Regards,
Malcolm

The 8558 AT needs the board - currently you can get the AT for about $400-$500. The one which doesn't need the board (built into it) is the current variant - one that goes with the 9323, and costs a bit more - have seen them second-hand from about the $600 upwards. This antenna is the better one to have as it tunes a lot quicker than the 8558 does - I always on the lookout for a well priced one myself as it irritates me when my tuner takes so long.
Possibly you could contact a comms shop here in Aust and get them to email the file (.DAT from memory) that needs to be burn't to the eprom (you would need to supply them with the freqs of course) - and then you could get an eprom burnt locally at your end. Alternatively there are probably people here on this group that have the software who could do the same thing for you. The chip is extremely common - from memory there are heaps of them found in the older radios, and I am pretty certain that you can still buy them.

Can you tell me how much one could expect to buy a new Codan auto antenna for over there??
One that doesn't need a board fitted to the radio and is self driven.
Regards,
Malcolm

Hi Malcolm - yes the 8528 has the capacity to program 100 channels via the radios front panel. A mod needs to be performed (soldering one solder bridge), and a particular version of the software (cannot remember which option software it is) needs to be burn't to the eprom. Once done, you can enter any Tx/Rx freq that you want to the P channels (99 channels) - the other 500 channels need to be burnt to the eprom.

I saw a message yesterday come up about the 8528 programming having to be done by burning the eprom. You may be right, but Ill quote you from the 8528 brochure printed by Codan. Quote. Under "8528 Features and Benifits" "Programable" Depending on the option selected, recieve only or transmit and recieve frequencies can be programmed from the tranciever front panel. End of quote.
The one that was in eBay had pre programmed channels plus a group that could be changed manually?????
Regards,
Malcolm

Topic: 136 Message: 1583

The txe option is strictly speaking, not legal for most people. The txe option needs a txe eprom and a small mod inside the set. Its permanent if you dont change those two things.

I can understand an agent not wanting to give too much away. Yes it's a pita but it's their bread and butter. Ever tried getting a plumber to do anything for free ?
Having said that this group has a wide range of expertise and resources availiable. We can and do assist , hopefully without treading on anyone's toes.
Any enquiries re eprom burning etc give me an email.

This is something I've always wondered about, because I'm of the opinion that it's incorrect. As far as I understand it, owning equipment which is capable of transmitting on frequencies which are not legally available to you is not an offence. For instance, I can legally acquire any number of amateur transceivers, and operate them - in receive only - perfecly legally - unless I transmit!

Jim, can you point me to any references which give a definitive answer on this?

Cheers,

Ian

Hi Jim,
I agree with you totally about people's livelihood. I are a radio tech myself by trade and try to help people where I can. I'm not talking about that. My prob is the only one agent in a country problem, 3 weeks to get a quote by having to ring and ask 3 times after being told it would be the next day. No interest in obtaining parts, told the model is obsolete and no longer supported when a later model has the same item and part number (vehicle cradle) and is available. Being a small part of the business etc etc. I'm really talking about the no competition problem. That's why I obtain my parts and equipment thru Australian agents and people where I can.
regards,
Malcolm

Ian you are quite correct. However when I said that its not strictly speaking legal, I assumed that possession implied useage. The ACA are not keen on just anyone having access to any HF frrequency. Whilst this may not be law, it is their (rightly or wrongly) their practise as I understand it.
I can't point you to a definitive source other than the ACA site, but I can give you an example of the practise. Go to your Codan dealer and ask him to do a txe eprom for you :))
Cheers

Yes Malcolm, I understand perfectly. I'm sick of firms that don't even bother to answer an email. There are some very good ones but many have a web presence and seem to check their email once a year! Either that or they can't be bothered with the small guy.
There is just no excuse for a business treating you as if you don't count. None ! Whether you are enquiring about a bolt or buying 1000 trucks, the service should be similar.
Luckily I can take advantage of that. I deal with the small guys as I would like to be dealt with myself. Sure, there's not a lot of money in it but at the end of the day I'm happy if my customers are happy.
Cheers
Jim

Jim,
Yes, you have got it in one. I'm the same with the small guy as well. Been working for myself since 86 and get really p*&%d off when I cant buy something at trade price and are told its the same price for everyone, lump it because there is no choice.....
Anyway, if you hear of an 8528 remoted and/ or Auto antenna going let me know.
Regards,

Malcolm

Yes Malcolm, I understand perfectly. I'm sick of firms that don't even bother to answer an email. There are some very good ones but many have a web presence and seem to check their email once a year! Either that or they can't be bothered with the small guy.
There is just no excuse for a business treating you as if you don't count. None ! Whether you are enquiring about a bolt or buying 1000 trucks, the service should be similar.
Luckily I can take advantage of that. I deal with the small guys as I would like to be dealt with myself. Sure, there's not a lot of money in it but at the end of the day I'm happy if my customers are happy.
Cheers
Jim

Hi Jim,
I agree with you totally about people's livelihood. I are a radio tech myself by trade and try to help people where I can. I'm not talking about that. My prob is the only one agent in a country problem, 3 weeks to get a quote by having to ring and ask 3 times after being told it would be the next day. No interest in obtaining parts, told the model is obsolete and no longer supported when a later model has the same item and part number (vehicle cradle) and is available. Being a small part of the business etc etc. I'm really talking about the no competition problem. That's why I obtain my parts and equipment thru Australian agents and people where I can.
regards,
Malcolm

The txe option is strictly speaking, not legal for most people. The txe option needs a txe eprom and a small mod inside the set. Its permanent if you dont change those two things.

I can understand an agent not wanting to give too much away. Yes it's a pita but it's their bread and butter. Ever tried getting a plumber to do anything for free ?
Having said that this group has a wide range of expertise and resources availiable. We can and do assist , hopefully without treading on anyone's toes.
Any enquiries re eprom burning etc give me an email.

Matt,

Is there a mod that allows for TXE permanently or do you do the mod at the board and then refit and go ?

> The 8558 AT needs the board - currently you can get the AT for about $400-$500. The one which doesn't need the board (built into it) is the current variant - one that goes with the 9323, and costs a bit more - have seen them secondhand from about the $600 upwards. This antenna is the better one to have as it tunes a lot quicker than the 8558 does - I always on the lookout for a well priced one myself as it irritates me when my tuner takes so long.

I guess this was my point, because as we know, there are legitimate
and legal reasons why somebody would want to re-program their radio -
(such as VKS737 or Bush Telegraph membership) but some people (read:
dealers) would tell you that it's "illegal" to allow users access to
re-programming capability.

You don't get the third-degree when ordering a crystal or two from
Hy-Q though!

Cheers,

Ian

(Looking forward to the day when all cars are limited to 100Kmh

From: Jim
Topic: 136 Message: 1591

Ian, I don't have any gripe with responsible users being able to buy whatever they want, and copping it sweet if they cause any hassles in places where they shouldn't be. But I'd hate to be the one trying to get medical assistance when someone has had a scotch or two and decide that it's fun to cause interference. I've had it happen and it isn't nice.
I know I'm out of tune with the "give it to me because I want it now and I've got the money" philosophy but I'm in full agreement with the dealers on this point (now thats a change! :)
If you look at the regs, amateur equipment is specifically banned from being used on the RFDS/737/BT and similar networks except in cases of emergency. There are very good resons why this is so, and it has little to do with service or sales. (And in any case a lot of amateur gear may not be suitable for the corregations etc that commercial gear often has to put up with...)There are other restrictions that are, perhaps , less rigidly enforced. But they are there, and can be enforced should the situation warrent it. A bit like the policeman who sees your rego sticker is out of date but has more important things to do...this time round :))
So where does that leave me ? No it's not illegal to own whatever radio you like. Use it irrisponsibly and you are breaking laws. Yes there are a lot of resonsible people who might wish to have txe options and programming software for the later gear. So how do I tell if someone is responsible or not ? I can't of course, so they'll probably have to go elsewhere.
As for cars, ever seen a 100k/h limited truck with a trailer being driven by a "responsible" driver overtaking you at 120k/h weaving in and out of heavy traffic ? I'll bet you asked yourself "who gave that dammed fool a truck to drive?" :)))))

Cheers
Jim

Topic: 136 Message: 1593

I really dont see what all the hoo-ha about tx-e is all about. why not install a switch and flick it on before you power the set up and program your tx p-channels. exactly the same effect as tx-e with minimal effort. tx-e is not a free tuning tx option. it only allows programming of p-channels with tx freqs.
http://ozradio.wireless.org.au/txe.htm explains further
BTW new 9350 antennas sell for around $1400. make sure you specify the older 8528/9323 control lead as they come with the different NGT lead by default now.
cheers

whatever they want, and copping it sweet if they cause any hassles in
places where they shouldn't be. But I'd hate to be the one trying to
get medical assistance when someone has had a scotch or two and decide
that it's fun to cause interference. I've had it happen and it isn't
nice.

Jim, I agree 100%.

> I know I'm out of tune with the "give it to me because I want it
now and I've got the money"

I don't recall this one entering the discussion!

philosophy but I'm in full agreement with the dealers on this point
(now thats a change! :)

If their reasons are to prevent misuse, that's laudable, but sometimes
I wonder.

> If you look at the regs, amateur equipment is specifically banned
from being used on the RFDS/737/BT and similar networks except in
cases of emergency. There are very good resons why this is so, and it
has little to do with service or sales. (And in any case a lot of
amateur gear may not be suitable for the corregations etc that
commercial gear often has to put up with...)

I understand the regulations, and I was not suggesting that amateur
equipment should be used for RFDS/737/BT, merely that it is freely
available to anyone. (As for durability with corrugations, I've
looked inside some Yaesu gear as well! ;-))

There are other restrictions that are, perhaps , less rigidly
enforced. But they are there, and can be enforced should the situation
warrent it. A bit like the policeman who sees your rego sticker is out
of date but has more important things to do...this time round :))
> So where does that leave me ? No it's not illegal to own whatever
radio you like. Use it irrisponsibly and you are breaking laws. Yes
there are a lot of resonsible people who might wish to have txe
options and programming software for the later gear. So how do I tell
if someone is responsible or not ? I can't of course, so they'll
probably have to go elsewhere.

> As for cars, ever seen a 100k/h limited truck with a trailer being
driven by a "responsible" driver overtaking you at 120k/h weaving in

and out of heavy traffic ? I'll bet you asked yourself "who gave that dammed fool a truck to drive?" :)))))

Well, probably more like "Who gave that damned fool the pills?" - But anyway, I've seen the odd bad truckie, but by and large, most are pretty good.... My point about the 100Kmh was not having a go at you or anybody in particular, but just to point out that drivers (like radio operators) are responsible for their own actions,

The point I was trying to make in my original post was that some people hide behind some imaginary legal reasons to maintain control over what frequencies are programmed into your radio - reasons which are completely invalid, because any fool intent on breaking the law can go out and purchase equipment to enable him to do so!

Cheers,

Ian

Ok Ian, it seems I jumped too quickly and too high :) I'm guilty, I do have a thing about this topic dating back to the introduction of cb etc. Wasn't the introduction, was the way in which it was done that I took issue with. Laws, dammed laws and radio inspectors I guess :))
My apologies. I can only claim that I was distracted at the time.

Hi Jim,
You seem to be the one that everone considers to be the oracle as far as Codan gear goes. So I hope you dont mind if I use your mind as well. Can you please tell me, with the Codan 8422 sell call units the series 4,5,6 units will not call the series 8 units but it will work the other way around. The series 85 HF sets will talk to the series 4,5,& 6 22's and vise versa. Is there the same problem with the 93 series radio's ie will they talk in both directions to the series 4,5 & 6 8422's??? Im told the reason the 4,5 & 6's wont talk to the series 8 is to do with the preamble of the tone being sent out.
I could have access to a 9313 with auto antenna but it wont be of much use if the others in the group cant call me.
Regards,
Malcolm Langley

I agree with Ben on this one here. I have never had access to
option txe and have never needed it, nce you know how to use the mod
with the TPE link. Most operators really only want to enter the odd
two or three frequencies here and there to keep up with changes in
service providers (Bushphone/Radtel/Telstra etc)...rather than
needing to change the whole configuration of the set, or multiple
sets, for which eeprom burning and/or software and cable becomes
more useful.

G'day all,

Is it possible to make, or buy, a single frequency aerial about 1 metre long?

I run a 2 piece Terlin tapped unit off the roofrack. Great product, but not really feasible to leave up while driving. I'd love to just listen in to say 8022 while driving

Regards
Max P

It sure is, but I suspect that the manufacturers would charge you a bomb for it. The better way to go would be to try and make it yourself or get a friendly techo (with plenty of time and gear) to do one for you. As I've posted before, if you have the basic whip, the rest is basically labour.

Is it possible to make, or buy, a single frequency aerial about 1
metre long?

I run a 2 piece Terlin tapped unit off the roofrack. Great product,
but not really feasible to leave up while driving. I'd love to just
listen in to say 8022 while driving

Regards
Max P

Hi Jim,
You seem to be the one that everone considers to be the oracle as far as Codan gear goes. So I hope you dont mind if I use your mind as well. Can you please tell me, with the Codan 8422 sell call units the series 4,5,6 units will not call the series 8 units but it will work the other way around. The series 85 HF sets will talk to the series 4,5,& 6 22's and vise versa. Is there the same problem with the 93 series radio's ie will they talk in both directions to the series 4,5 & 6 8422's??? Im told the reason the 4,5 & 6's wont talk to the series 8 is to do with the preamble of the tone being sent out.
I could have access to a 9313 with auto antenna but it wont be of much use if the others in the group cant call me.
Regards,
Malcolm Langley

1602. Why you would want Option TXE was RE: [codan_outback_radio] Re: 8528

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-07-14 06:55:11 UTC
From: Craig Huxley
Topic: 136 Message: 1602

Well I may be a bit different to some of you guys as I am not an amateur but have the Codan for keeping in contact when in remote areas and/or for emergencies.

Although we can free tune the Rx on the radio there is no way of transmitting on that freq unless you can manually punch in the Tx freq like with Option TXE. If it was a matter of emergency and that was the only freq I could either tune the radio too or get a response on I would say possession of TXE capable radios would be preferable.

Now you and I both know we can mod the radio....but what about the other punters out there.

I have used radios with TX E and its good.

Cheers

Craig

Max,
Here in NZ we have a local manufacturer who makes up the antennas to single frequencies. they are about 1.8mtrs high and are spot on. I find it easier to sell 2 antenna, one for day and one for night than to import a multi tap antenna from RFI in Australia. they are top loaded on a linear fibreglass former. Don't suppose that helps you much though???

It sure is, but I suspect that the manufacturers would charge you a bomb for it. The better way to go would be to try and make it yourself or get a friendly techo (with plenty of time and gear) to do one for you. As I've posted before, if you have the basic whip, the rest is basically labour.

1605. Retap whips.

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-07-14 10:54:19 UTC
From: vk8n
Topic: 1605 Message: 1605

RE trying to retap whips

Playing with my HF on the weekend I noticed if I placed my hand around the lower part of the aerial and move it up and down the section where the leader wire goes to the tap I could suddenly hear stations that were before to weak to hear while using a tap from say 100 khz off where I want to be.

The question is, can I change the length of the leader wire to change the frequency the whip is tuned to. I have several taps with in 100khz of where I want to be and I do this hear very them very well. BUT (dont laugh) DONT TRANSMIT. I was lucky to be using a 9624 30 watt max and I had a strange feeling up my arm for a little while after pressing tune.

Thanks to every one who gave me information both on and off group If I ever work out how to do it a cheap way I'll post the lot.

Just incase some one asks why I dont buy a new whip. Answer is not money, I just hate to see good old stuff go to waste. I do run a reliable (Did fail just recently) 8525 with 8558 auto tune, with a back up long wire, I can't stress enough the importance of a backup aerial. Just ask me and I have a story to tell.

You sure can. There are other things you can do also, like trying a bit of tinfoil around that section etc. May not be technical but if it works, why not.

OK vk8n I'm asking. I always carry a manual tuner and long wire and rig it up now and again just for the hell of it. It reminds me of my crystal set days all those years ago. Oh what a mystery it was back then(and still is). I can remember when the overseas news service from the ABC was rebroadcast from HF transmissions with all the fading and atmospheric noises included. There is something magical about getting a box of bits hooking it to a battery, throwing a wire over a tree and talking to someone God knows where. I have a Barrett 250 and a Codan 8528 with 8558 ATU. I will probably sell the 250 later but am reluctent for sentimental reasons apart from the fact it's a magic set for its age.

Max,

I got Terlin to make me just such a thing. I wanted an 8022 single freq aerial that could stay on the car and have a lower height than the roofrack. Additionally, I carry it as a backup to my 8558 when travelling.

Cost was about $130 (about 2-3 years ago), and they will make it to what ever length you require. It is made in a similar way to the Terlin tapped aerials so it is very good quality.

Ian B

PS: Since my move to Canberra, the roofrack has had to come off so I can get into carparks, and my aerial is now too long. I've been considering selling mine and getting another that is a little shorter...

Craig,

I could see this being more of an issue about 15 years or so ago, when there weren't many people at all on HF. I remember with my first set, all I had was Telstra and RFDS and there was one instance where I had a sick kid out in the Bush and was not able to access any of the telephone interconnects and it wasn't quite serious enough to Alarm the RFDS at night.... but now with all the different networks out there (VKS/VMS/Bushphone/Radtel/RFDS/Penta/+++ etc) I can't really imagine not being able to contact someone. Yesterday afternoon on my way to work, I was able to get revertives back from every Bushphone interconnect except Darwin.

Alhough I think TX-E would be nice to have...just to have it.

Cheers,

Mark

If your looking for a HF whip I think you will find its efficiency will be VERY low with that sort of length (yes it may match but it needs to radiate RF to be useful).

If your looking for a HF whip I think you will find its efficiency will be VERY low with that sort of length (yes it may match but it needs to radiate RF to be useful).

Perhaps laying the antenna over when you require clearance might be a better proposition.

Interestingly enough Terlin made some RFDS specific whips that were only about 1 m long.
Cheers

Another option is to move the antenna to the bullbar. PITA to remove all the time, and can be more easy for light fingered scum to remove, however gives you a lot more clearance in the burbs. Won't get you into underground carparks, however it could be temporarily bent back without to much of a problem - assuming a spring is used of course.

All

I am new to the HF scene and would be interested to meet up to another NGT user in Perth (or someone very familiar with the NGT) to assist me in cutting my teeth on the new radio.

I'm down in Mandurah but willing to travel!

Regards

Phil

Topic: 1617 Message: 1617

Hi everyone,

I have been repairing cb radios for some years now and have been approached by a few people to repair their codan radios.
This is something I would like to be able to help them with but I do not hace any codan circuit diagrams, and without them it is almost impossible to affect other than the simplest of repairs. Any help with any diagrams at all would be much appriciated both by me and the owners of these dead radios. It is the 7727 that I'm looking at at the moment because the regular techs dont want to know about them and would rather sell u a new unit rather than spend a couple of hours fixing these old sets, and as it is my hobby I dont charge an hourly rate like the techs have to so it makes the old sets viable to repair. If anyone can help please email me.
Many thanks
coocar@...

1619. Codan 8525B Scanning

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-07-17 09:37:28 UTC
From: Rodney
Topic: 1619 Message: 1619

Hi one and all. Being a relative newcomer to this HF scene I hope this question has not been asked and answered before. I have a Codan 8525B that appears to work fairly well etc. I tried to program the scanning channels tonite but get an E3 error on the display. According to the manual this means that the programming function with regard to scanning is disabled. The manual also states that this disabling is done by linking 2 pins on the Microprocessor Interface board.Plug P2 linking pins 1 & 2 according to the manual. Lo and behold upon opening the set I cant find the right board or any such plug designated as P2. Is this scanning function an option that I dont have? Does anyone know where the Plug and pins should be. Everything else appears to be there with selcall board and remote auto tune for the antennae etc. Any advise as to where the board and plug/pins should be gratefully recieved. Page 10 of my Manual section 5/E.

Thanks for reading this query

Marty,

If the 7727 is a 7727C I may be able to send you a copy of the service manual for the price of having it photocopied. Please forward your email address and I will get back to you.

Topic: 1627 Message: 1630

If your radio is off frequency on one channel, it SHOULD be off frequency on ALL channels. There is a master frequency clock adjustment that everything is derived from. There isn't an individual adjustment for a channel or band. Better check other channels too...
Regards,
Michael.

1635. How to adjust 8528 power output

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-07-24 22:39:52 UTC
From: Nazario C. Culanag Jr.
Topic: 1635 Message: 1635

Hi, I am an amateur from the Philippines. I recently got an 8528 from a military junkyard. Everything works well except for the number 6 on the keyboard. So I can't key in a frequency with a number 6 and store in any memory location with a number 6. That is not my major concern, I can live with it. I know from the manual that this thing is capable of putting out 100 watts. It is currently putting out only 50 watts. Would anyone have the information on what possible values of resistor I have to shunt on the PA board for it to put out 100 watts?

1636. Re: [codan_outback_radio] How to adjust 8528 power output

Thanks Jim for the reply. It is connected to the the MFJ-949E which is an antenna tuner with built-in wattmeter. No matter how much audio I put in to the mike (i've used several types) but it only gives out 50W max. According to the manual, depending on how much power you want (max 100W), use the appropriate resistors included in the shipment. Obviously, I don't have them except the one that is already connected. The manual did not say what values are included or are my choices.

I've never heard of anyone having to play with this resistor value. Unless there is a problem in the drivechain or PA, the power should be ok. Does that wattmeter have an inbuilt dummy load or does it rely on you having a resistive load of the correct impedance on the end of it ?

Jim,

It has a built-in dummy load, I will check the output when connected
to the dummy load. Thanks for the advice.

Hi Jun, yes check that first. Your tx may have a power problem in the PA or something but I'd look in the 28 manual (its on Bens page if you dont have one) as it tells you how to measure the power and the different readings using the different types of meters.
Cheers
Jim

Subject: [codan_outback_radio] Re: How to adjust 8528 power output

Jim,

It has a built-in dummy load, I will check the output when connected to the dummy load. Thanks for the advice.

Jun

Also, is the measurement PEP or average?

I've never heard of anyone having to play with this resistor value. Unless there is a problem in the drivechain or PA, the power should be ok. Does that wattmeter have an inbuilt dummy load or does it rely on you having a resistive load of the correct impedance on the end of it ?

Thanks Jim for the reply. It is connected to the the MFJ-949E which is an antenna tuner with built-in wattmeter. No matter how much audio I put in to the mike (i've used several types) but it only gives out 50W max. According to the manual, depending on how much power you want (max 100W), use the appropriate resistors included in the shipment. Obviously, I don't have them except the one that is already connected. The manual did not say what values are included or are my choices.

Try measuring output while doing a selcall or beacon call....any number just to test it. I thought that was the only time they put out the whole 100w?

Cheers

Craig

Craig is right, during selcall they run at pretty near 100% modulation. They will do 125W PEP, but ACA regs throttled them back to 100W for Oz(hence the need to change resistor). You can also hold in the tune button which will produce an AM carrier to measure power output

Jim, Matt, Craig, Ben:

Thanks for all your messages, I did try using tune because it is the way I tune the tuner and it is set to read average, but it reads only 50 watts maximum. I reacon they have regulated the output because it came with a 9002 modem and may have to work 100% duty cycle. It came with a 9114 power supply also.

If the PA has been doctored to reduce Power in, this will show up if you check the current drawn by the set on TX.

Jun,
Why don't you check the current drain, if its drawing about 10 amps or more It's probably doing 100 watts.

From: Matt
Topic: 1635 Message: 1648

I am not 100% certain, but the 8528 is rated to 100 watts (or some up to 125 watts) PEP - the power on tune (essentially an AM carrier) would more likely be about 1/2 of that - with my other HF radios (Icom IC706IIG and Alinco DX70TH)have 100 watts output on SSB, and about 40 or so on AM.
You may want to try testing for the amount of power out on SSB using a PEP measurement.
If I could find my HF power meter, I would check my power output to see if I get the same amount of power out on tune with the 8528 - btw, I believe that with the auto tune function on the DX70TH, tune power is only 10 watts. Is anyone else with a HF power meter able to check how much power output they gain with the tune button down?

From: Miodrag Spajic
Topic: 1649 Message: 1649

Hi all,

Problem should not be considered as such tough one.
What is the original value of the resistor in question (for 100 watts output PEP facory set, of course)??
Is it so? If yes, the problem of low power is somewhere else.
For example, if I want to low the power (PSK digimode) to say 25-30 watts, what the value of resistor I have to choose?

And, of course, forget any test - CODAN IS THE BEST!!!!

Cheers

73's de Misa YZ1MW

Hi,

Thanks everyone for replying to this query. I have finally found the answer in the Technical Service Manual Chapter 7 Adjustments. Under Serction 7.5.4 Power Output and Intermodulation Distortion, it says:"The indication of 100W PEP with two tone modulation will depend on the type of meter used to make the measurement as follows:
Peak reading meter - 100W
RMS reading (thermal)- 50W
Average reading (Bird Model 43: 40.5W"
From this I think my 8528 is already putting out what it is designed for. The rated output is 100W PEP, 50W RMS.

Thanks...Jun

Anyone know where I can get the following

I intend doing slow scan television mobile and am in need of either a 4N29 or a 4N33, 4N25 or 4N32 for a push to talk circuit. DSE do not appear to have them in stock Due to the long tx of sstv mode can I still get the fan option fitted even though the ever reliable 8528 is getiing long in the tooth

Yep - different to mine as well - as best as I can work out from the rather blurred piccy, there appears to be an extra button or two (including the OTC one), not to mention an unusual colouring of the face.

I'm still waiting the UN 8528 and 8528s CODAN then I'll let you know,
probably I shall put one or two photos on my web-space. I'm quite sure that
they have the OPTION TXE that allows direct entry of transmit frequencies
from the front panel.

Ok no worries. TXE is a great option, found often outside Australia. Over here we have restricted its use and I'm reluctant to sell one inside the country. I do, but I've got to be pretty sure of the person first. Outside the country is no worries.
Will be interesting to see them on your webpages as the 28's came in many flavours. Some were coloured red or blue. Different options for different markets.
Cheers
Jim

Hello all, well the 8528 RADIOPHONE or outback radiophone was offered in 2 colours so it would colour co-ordinate with your 4wd. It came in brown / tan and grey. Personally I like my grey faced one, it isn't as stark as the black faced standard 8528. Some of the extra buttons where for as follows:
1) OTC call, it sent a tone to alert the OTC radio operator that someone wished to communicate.
2) OTC Telcall, to enable an automatic telephone interconnect call with listed TELSTRA/OTC marine radphone bases.
3) I can't remember the other one, and the cars all locked up for the night.

The UN ones I ahve seen all look like the standard commercial black faced models except for some with special faces in different languages, these have come in different colours.
Regards,
Sam

Anyone got a couple of 7727 radios to convert as a repeater,
just work out what frequency pair to use
sounds a good idea maybe install a few around the scrub

i guess its really a option in a amateur context the HF repeater
not on the 4x4 or bush frequencys

ajbalm,

There are 2 models of the 7727 remote type
The 7727T was the first of the 2
The 7727TB was virtually the same except it has an illuminated channel display
Up to 10 channels, crystal controlled, 100 watts. Some parts hard to get.
Some have a rear connector for operating antenna selectors. Will support Codan sellcall if fitted with the Codan 8422 selective call unit.
I operate 2 of these, after retuning the sets back to manufacturers specs they both work excellently

Regards,

Malcolm Langley

I will shortly have a quantity of 8525 available for a reasonable price (uncertain of exactly how many, will find out shortly). Radios come without antennas (sorry there were no autotunes available at the time - only a bunch of tapped whips which were for non RFDS freqs), and currently do not have chips. Will likely have chips burn't with RFDS, VKS737, and some RX only freqs(ABC/VOA etc) - if people have any specific freqs they want, let me know and I will have them included on an individual basis. Have yet to get my hands on the radios yet, so not sure of condition and price, but should be reasonable (price at least), and they will probably be checked over by my local tech. Believe that they are mainly remote models (mix of A & B models from what I have been told).
Will post more information when I have it, but would probably be looking at a couple of weeks before any would be available.

I have a 1980 version of the 7727t and would like to know if anybody can help me out with a schematic/service manual as I would like to add a clarifier and tune some new crystals into it (VKS737).

Any help greatly appreciated, ta Matt

1680. Dual head radios

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-08-07 13:34:57 UTC
From: Matt
Topic: 1680 Message: 1680

Evening all. Have been thinking about a radio that I had a play with many moons ago - it was a marine codan that had two remote heads controlling the same radio. Does anyone know if you can make the 8528 do the same thing? - i.e. one head is with the master, and the other is capable of controlling the channels, volume, scan functions etc? The setup that we had did all this, but for the life of me I cannot remember the model (seem to recall it had between 250 and 400 watts output though), and it would be an excellent way to solve a problem that a mate has. He has a couple of HF freqs licenced for work, and has his base setup in the house, but wants another one setup in the office (about 20m from the house). Rather than setting up two antennas and two radios (and neading to remember to turn one off when using the other one obviously), it would be much easier if there was but the one radio which had two heads for use - one in the office, and the other in the house (so the wife can still get a bit of kitchen time <G>).
Currently he has an 8528 remote head - is anyone able to help with suggestions or information?

Matt

The interconnect is a possibility - have one here in many pieces, but I should be able to restore it (it did suffer from a complete battery meltdown prior to me getting it), although I am not keen on wasting an interconnect on something like that. I agree that the long cable length to the second head could be a problem though.
When you say that the heads are slaved together, what do you mean by that? Do you mean that the cables need to be paralleled to each other, or is there some other arcane method of doing this - I would have thought that there would be the potential to increase losses by connecting the two together, and secondly that there would be the potential for interference between the two heads if there wern't some mechanism (filters of some sort?) to prevent this when one of the heads was talking to the radio?
He will have (once the office is completed) a couple of computers networked together in the office and in the house, so maybe some sort of link between the computers? Suggestions anyone?

The local acts as a local control, and the remote has exactly the same function. The remote plugs into the remote socket , there is a filter board as part of the remote option. So one cable to remote.
Now it depends on the radio, I know that the 9323's can be computer controlled, and easily enough by more than one computer.

Codan actually make a product for this purpose.
its called an 8571 (?) or similar remote control interface. It allows remoting a head, or a console type control panel as far away as you like. The units are self compensating for line loss (up to a point) trick is you need to use the remote head socket on the transceiver, so to acheive the result you are after here, you would need a local control radio. Whatever function or display is performed on one head, is copied on the other. you need one each of these interace units at each end of the line.
A 4wire E&M version is also available so you can use a RF link between the two units. This is used when the transceiver is located out in a paddock somewhere nice and RF quiet and the control unit, or telephone interconnect is located back in town. RF linking is not common, the most usual method is a leased private line between the two units.

Hi group,
I am just beginning to research the purchase of a HF radio. I am planning on doing a bit of remote exploring and it seems that this is the way to go.

The fact that a mate of mine can talk to another mate on the other side of the country absolutely amazes me as well.

I don't know the codan model numbers and want to know:

1.Where to start.
2.What is a good reliable basic setup
3.What should I expect to pay for a 2nd hand setup

any tips for a newbie guys?

cheers

Hi Wayne. The addition of a decent HF radio to your 4wd can prove both a life saver and company. (entertainment?). There are a few kinds of accessable HF brands around but Codan's radios are generally accepted (even by the UN) as being world class gear.
The kind of radio you get will be dictated by your wallet ("Such is life"). New ones come in at around 4K..(the NGT) .for that you get state of the art. Then you can go to the other end of the secondhand scale and buy a perfectly reliable 8525 which will do pretty much what you want in a basic setup for about $500. Don't forget you'll need an aerial also. These can vary in price with a 9350 autotune coming in at around 7-900$. There are cheaper ones at about 450 (the 8558).
Have a look at www.ebay.com.au
For a quick squiz at recent Codan prices go to http://www.jimshire.aussiewide.com/ and click on Codan prices in the margin. A great site to peruse is Bens Codan pages at http://ozradio.wireless.org.au/.
I'm sure others will think of things to answer your questions but it basically boils down to what do you want from your radio and how much can you afford to spend.
Cheers
Jim (Stay off the Canning next year, a mad bloke is planning on being there...me)

Hi Wayne
Jim, as always, has proven his worth. Listen to him and you cannot go wrong. One thing I will add, if you do come across a good second hand one, just remember, they don't stay for sale long. Normally snapped up very quick. They are an item that once bought, stays with you a long time.
Regards
Keith Aller

Topic: 1695 Message: 1698

Hi Wayne - I have recently come across a number of remote head Codan 8525 radios. Looks like I will have 2 maybe 3 of the A variants available for sale (the B variants I have are already spoken for). I am currently going through them at the moment, and due to a variety of reasons, my time is just a little limited at the moment, so it will be a couple of weeks before they are available for sale.
The 8525 is a 100 watt HF radio capable of being programmed with 100 channels, and is of mid 1980's vintage. If you have a look on Jim's radio pages, you can see what they look like - and I will second Keiths comment - Jim really does have a wealth of knowledge in this area, and we are lucky that he is willing to share his knowledge and experience (Hey Jim - does that get me a discount next time I buy some gear from you<g>).
I do not have an antenna to go with them, so you would need to source that seperately. Sometimes you can be very lucky and pick up the antenna you want for a low price, but usually it can be a couple of hundred bucks even for a multi tap antenna - maybe someone here on the group might have one spare that they want to get rid of - well maybe.
I will advise the group when these radios are available, and the price as this is yet to be fixed.

On a different note to the group, I almost pissed myself with laughter reading the info on a website - there is a 4wd hiring mob who are advertising 8525 radios for sale for $1100-1400 with a multi tap antenna included. If you want a good laugh, have a read of their explanations about the different radios that are available - an example of that being that a SSB 27 MHz CB has 120 channels (i.e. 40 channels for AM, 40 for LSB and 40 for USB). Mostly good explanations, but some rather funny bits amongst it.
Prices for radio hire are pretty decent - not to sure about the other areas though as I usually buy what I want rather than renting.
http://www.desertaccess.com.au/html/communications.html
Appologies if this site belongs to anyone on this group, but I did find it very amusing.

Matt

Thanks guys,
I have been lurking for awhile and i have noticed Jim is always there with the answers. Not that I would know if he's right :) but you guys would and there seems to be some respect there so i guessed he's a guru on the list.
Thanks Jim for the comprehensive answer.

Matt, Thanks for the advice, i will keep a close eye on the 8525's coming up. where are you located, I am in Sydney. What is the difference between the A and B variants...power, capability, size?
oh and good luck with the discount :))

Keith, I agree that it will be a longtime investment so the price may be high but the years of use and the safety aspect make it a worthwhile one.

Thanks again
cheers
Wayne

I purchased an 8528 and a 8558 from Jim and have met him. I found him excellent to deal with and is true to his word and is more than willing to share his knowledge and if he can't answer a query he will say so and offer advice as to finding out how. His "workshop" looks a bit like mine.....very homely and unique if you get my drift.

Hi Wayne - the main difference that I am aware of between the A and B variants is that the B variant is a later model, and whilst there is nothing physically that sets it out from the A variant, electrically it is slightly different in that with a head from a 8528, and an 8528 eprom, it becomes an 8528. The B model otherwise is the same as the A model - i.e. still 99 channels, same power output, etc.
The B model is more sought after for that reason, but the biggest problem is that getting hold of 8528 heads is a bit like looking for hens teeth - very few of them are around and available.

Physically the 8525A & 8525B look the same, electronically they are two totally different radios.
The only thing in common between them is the outer case.
Every sub board is different apart from the base motherboard that everything plugs into.
You can convert an 8525A into 8528, it involves swapping the lids!
cheers
Ben

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-08-15 07:40:44 UTC
From: Ben Hobson
Topic: 1709 Message: 1709

I have received notification from Yahoo, that on the 21st August, all attachments to messages in the archives will be deleted. The messages themselves will not be deleted, just the attachments.

/quote
Email attachments will no longer be archived in the Messages area, although
Yahoo! Groups will continue to deliver attachments sent by email. On August
21st, all attachments in the Messages area will be removed, and Yahoo! will be
unable to retrieve the data. Please note: All of your group messages will
remain. Only the attachments will be deleted.
/unquote

If anyone knows of any particular attachments that should be saved, please copy them to the files area, which now apparently needs a web membership. I am assuming this is a Yahoo ID which most have anyway. Currently the group is configured to not allow attachments via email, so as usual any future files to share, put them in the files area

/quote
Files and Photos:
You will now need a web membership to access a group's Files and Photos areas.
To make sure you have web memberships to all of your groups, please visit this

1716. Introduction & Question

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-08-15 12:33:42 UTC
From: John D
Topic: 1716 Message: 1716

Having just joined this group, I'd better introduce myself.

John Dubbeld, early retired (in '96) and living on the Sth Coast of NSW.
I've used HF radios (Hawks) as a means of communication since the early 80s
when I was involved in machinery maintenance in North Queensland. These were
basic sets, and
we did not have selcal etc. We did have the emergency tone call fitted to
all our units.

At the moment we travel a fair bit in remote areas, and use a gps and laptop
for moving map purposes together with a satellite phone for emergency
communications if needed.

I am getting a Codan to complement things as well, and need some advise.
I will buy it second hand (anybody want to sell one?), and do not want to
spend too much on it if I can help it. Are selcal, radphone, gps
connectivity etc. a must?
Or what would the forum's opinion be of minimum requirements?
I'd like a 9323 series but would an 8528 do much the same job ?
What about a remote head 7727 ?
I'd appreciate your input.

Regards,

John

Hi John. Well i'll do the usual (there he goes again !). Firstly welcome to the group.
They're a great bunch of knowledgeable types. Usually busy but always ready to help.
Radios ...depends what you want to do with them.
Want everything ? ...get an NGT.....around 3-4K
Phone connect and GPS ? Get a 9323 with a 9350 autotune...around 1500...2k
Just the phone and usual 4wd chan, selcall ? 8528 with 9350 or 8558 autotunes.
Radio will cost about 7-900 and aerial about 450-800 depending on type etc
No direct dial phone or gps but still want selcall, 99 chan, etc...8525 with 8558 autotune.
About 600 + aerial
Can get out in the rain and dust to change a tap and dont flit from frequency to frequency
?
Use a whip. Much cheaper than autotune .
Yes the 7727 can be used but it may have selcall issues when used with later sets.
Really cheap ? 7727TB's, 6801's or even a 6924 manpack. (no selcall or mute but highly
portable)
Thats it in a nutshell. I'm sure others may comment .

Cheers
Jim

Jim,

Your usual comprehensive answer :-)

Also, don't forget that all members of the RFDS Outback Travellers Club (forget the URL, but www.flyingdoctor.net may have a link)go into the draw for another Codan NGT this November.

Also, Central Communications are the other Codan dealer in the Alice.

Well Jim pretty much sums it up. There are a couple of codans on ebay at
the moment, and excuse the bad language but I think a barrett as well.
The prices they pull there are at the upper end of the price range.
With the older 8558 autotune check the serial number, try to get one
starting with C or D as before that they had clear plastic tubes in the
guts which fracture pretty easy.
more on antennas/radios etc at http://ozradio.wireless.org.au
Lots of piccies of various models to identify them too.
If you just want comms for backup then bushtelegraph is the go
http://www.reidsradiodata.com.au/
If you join the RFDS outback travellers club for around $33 a year, you
get membership to the basic service.
http://www.flyingdoctor.net/central/ is the info

1720. Some prices

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-08-16 02:23:21 UTC
From: Jim
Topic: 1720 Message: 1720

Further to my quick sketch of secondhand radios and current pricing structure, I thought I'd post some prices I've been quoted ex Perth for mint condition radios.
8528/9350 antenna $1800
9323/9350 antenna $2200
NGT/9350 antenna $3000-$3500
Please note this is not an ad for anyone. I'm not selling these radios. The prices are merely for the groups' edification :))

Cheers
Jim

Looks like the marine variant (S model) - not that it means that there is all that much of a difference to the standard 8528 model.
The seller is lightly inaccurate in his information - the 8528 does have the capability to programme from the front panel 99 channels, but it also has 500 channels that are burn't in to it for which you would need the software - and Codan doesn't normally hand it out if you ask them to - might sell it though (well maybe).
Power output may be correct - here in Aust we are limited to 100 watts for mobiles, but being a UN sourced radio, Codan may well have configured it for 125 watts - mind you the difference between 100 and 125 watts is not noticeable.
The radio may well have been programmed with LU, but does it have the LSB crystal? No use on LSB even if it has been programmed that way without the crystal.
The description of the radio as being a para military radio is a little unusual - particulary if advertising to the Australian market - describing it as a RFDS (Royal Flying Doctors Service) radio would be much more informative.
The reserve of $US 150 is reasonable, but I would be more concerned about getting it into Australia - bearing in mind the sale appears to be originating from Italy, and given that I do not know the seller, I would be concerned about the origin of the radio (i.e. I would want to see a receipt showing that it had been sold by the UN).

Matt

Hi Jim,
I see that there is one of this CODAN RTX on E-Bay (item n.
2187937719) what is your knowledge about CODAN 8528 S? Thanks. Federico

marty,

It is good that you received the manual quite ok and are pleased with the information in it. I had forgotten about it until you had mentioned it.

hi to all,

My name is bill, I have been with this group about 3 months.
Would any one know where I could get a copy of the service manual for an 8727 codan hf radio please.

I could pay for the copying and postage needed.

Many thanks

Bill Watkins

From: Jim
Topic: 136 Message: 1730

Hi everyone. Thought I'd give this group first go again. I'll have a Codan 8528 radio ..no aerial unfortunately...for sale shortly. This is in good nick and will probably sell in the upper price range (ie its not a cheapy) to cover my costs. If nobody is interested it will end up on ebay.
"The unit has been tested and control head has new escutcheon fitted (outback type). Condition is good. No mounting brackets. Microphone is supplied. Also, cable from head to set has facilities to drive auto tune."...yeah I think they mean it has an AD board :))
Cheers
Jim

Try McKays Communications in Dubbo. Authorised Codan agent
Ph 1300 656 186 or 02 6884 5237. They are the same cable as an 8528
txcvr to 9350 antenna.
Be aware that some 25's wont drive the 9350, in particular the 25A's

I dont know the 9323 mic plug but if it is the same as the 85XX series. ie the 7 pin plug . RFI stock these, you should be able to get one through your local two way dealer OR try Farnell components.

Regards

Paul

Graeme,

Call Peter James in LARA,(0418 599355) Victoria, He sells the microphone cable complete with the microphone shell as a spare part for the 9323.

For other readers he also has available an ANTI THEFT NUT to use to bolt down your 9350 autotune antenna. It has a free spinning collar that cavers the special nut so it is twice as hard to remove them. Much more secure than the padlock in the hole of the bolt.

Tony

Bits of trivia. The Codan 6924 appears to have had a mute board...at least in NZ (special order?) where the Codans were once produced. I'm surprised that they were never produced with selcall (they weren't, were they ?).
The Codan 8528 was also produced with a 400watt output amplifier..but only for 24volt.
A lister has recently imported some Codan gear from Europe..(talk about coal to Newcastle.)
The digits of all Australian AM station frequencies add up to 9 (yes things are slow around here on Sunday).
Cheers
Jim

The 400W PA was a seperate 19 inch rack mounted unit. The Transceiver to drive it was called a 8528H. The PA section was removed and replaced with an exciter. The whole lot was designed to be used in a base station arrangement, or more commonly a telephone interconnect (TIC)
The 9323 has the same option.

Bits of trivia. The Codan 6924 appears to have had a mute board...at least
in NZ (special order?) where the Codans were once produced. I'm surprised
that they were never produced with selcall (they weren't, were they ?).
The Codan 8528 was also produced with a 400watt output amplifier..but only
for 24volt.
A lister has recently imported some Codan gear from Europe..(talk about coal
to Newcastle.)
The digits of all Australian AM station frequencies add up to 9 (yes things
are slow around here on Sunday).
Cheers
Jim

1754. selcall

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-08-25 03:00:18 UTC
From: marty
Topic: 1754 Message: 1754

Hi everyone, its me again on the scrounge for more information.

Can anyone tell me what the selcall format is that is used in the hf radios in australia, namely the outback type used by the vks 737 clubs and alike and possibly a link if im very lucky to a site on the net describing it. There are several diferent formats used around the world so beware of imported equipment.

1756. Power supply pinouts

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-08-25 08:56:15 UTC
From: Mark
Topic: 1756 Message: 1756

Just wondering whether anyone has any info on Codan 7113B Power supply.

It has 2 'Jones' plugs on the rear and I would like to work out the pinouts for main power supply and trickle charging a backup battery.

There seems to be lots of pins...for what I'm not sure...

Cheers,

Mark

1757. Re: [codan_outback_radio] Power supply pinouts

From: Jim
Topic: 1756 Message: 1757

Mark, take the top/bottom off. Two thick leads red/black will be to top conncector, they come from the large filter caps.....main supply. Bottom plug wires come from a circuit board, battery float.
Cheers

Hi Marty, I have a paper here, at least it was on the weekend when I was going through my CODAN books, that is from CODAN and gives a disertion into the selcall code, format, duration and data carried, it is four A4 pages including diagrams. If you want, when I lay my hands on it, I can scan it and email it direct if you want. It was originally put together for radio techs sent to CODAN training workshops and for technical briefings to departments.
The CODAN Selcall format is now an International Selcall Format (It had to, once the UN started using it! :-)) and has a proper ITU/IEE number for the format type and FSK emission.
Regards,
Sam.

Any possibility of placing the scanned document in the files section? I would be very interested
to read the entire thing.

Failing that, I would be pleased to have an electronic copy if you would be so kind.

Regards

Sam,

Maybe you could load it up in the files section, but if not I would also be interested in a copy.

Thanks,

Brian.

Hi Marty, I have a paper here, at least it was on the weekend when I was
going through my CODAN books, that is from CODAN and gives a disertion
into the selcall code, format, duration and data carried, it is four A4
pages including diagrams. If you want, when I lay my hands on it, I can
scan it and email it direct if you want. It was originally put together
for radio techs sent to CODAN training workshops and for technical
briefings to departments.
The CODAN Selcall format is now an International Selcall Format (It
had to, once the UN started using it! :-)) and has a proper ITU/IEE
number for the format type and FSK emission.
Regards,
Sam.

Hi all, due to the huge demand.
And, to be fair to all, I will upload it to the files section, once I find it that is. My wife has just admitted to me, when I asked her where a pile of my papers had gone, that she had committed a neatness and put them away :-(. She now can't remember where, so the boxes of papers (current bills and correspondence.) will have to be sorted to find it. I will try and get it uploaded by the weekend and there will then be a message generated to the group of it's uploading.

Regards,
Sam

Well all those who requested may now peruse at their leasure. Paper consists of 4 pages, I think the flowchart included another 2 pages but I have misplaced them or something, but the main info is there.
NOTE* these details are BEFORE the 6 digit selcall and the DATA Message selcall format implementation!! Both these extra formats basically include an additional format ID and extra encoding digits + CRC. I have no other info on these formats.
Also uploaded, for those having trouble with their 9350 antenna not tuning, the mechanical position vs frequency tuned chart which should be in scale if printed to an A4 page. The vertical line corresponds to the travel of the tuning slug in the slot where the rod joins the motor.
Enjoy,
Sam.

1779. Codan 8525A remote head for sale

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-08-26 21:11:01 UTC
From: Stuart Mitchell
Topic: 1779 Message: 1779

Thought I would do the honourable thing and offer this to the group before I put it onto ebay.
I have a Codan 8525A remote head for sale.
This radio is in excellent condition and is fully functional.
Has Flying Doctor button and selcall options. Includes 737 and bush telegraph, RFDS and some broadcast frequencies. Comes with mic and mounting brackets.
Can email you a photo and list of frquencies if you wish.
contact me mitchell@... . I may be away for a few days so be patient.

1780. 8528 and 9323 RX/TX switching

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-08-25 14:28:29 UTC
From: Graeme and Lillian
Topic: 1780 Message: 1780

I have made up the interface to go Slow Scan Television mobile on the 8528 on 14.236.00. Using the 8528 on this digital mode should be okay but I am interested in doing all the ham radio modes, e.g pactor, gtor, rtty and packet. Can anyone tell me the timing of the switching from transmit to recieve. I would also assume that the switching in the 9323 would be similar or better than the 8528 but not up to the standard of the NGT so maybe an upgrade might be in order.
Also do Codan still put the fan option on 8528 or would a computer power supply fan be enough powered from the 12 volt A rail inside the radio. Any thoughts from the group most appreciated

Graeme

Graeme,

Can you share the SSTV interface schematics with us very interested Codan lovers? I thonk PSK is the best - try it!
I'm also PSK fan - you don't mention that mode - PSK31 need only 10-20 watts to work all around the world and on all bands. Great thing no neighbour troubles!
Computer power supply cooler is must on the Codan heathsink!

Good DX and 73

Misa, YZ1MW

Hamcom interface? Or are you using a sound card and JVComm and/or MixW?

I think a PS power supply fan would do the job nicely. Try and pick one with
a ball bearing as opposed to sleeve bushed, the latter tend to dry out and sieze
far more readily even in computers....

I'm just wishing there was a way to persuade my 8525A to work on the ham bands...

with a manual, is there anybody out there who would have a
manual that they no longer need and want to sell.

would be much appreciated
leon

1786. SSTV Interface

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-08-26 02:45:00 UTC
From: Graeme and Lillian
Topic: 1786 Message: 1786

I am using the typical setup in this interface with the PTT setup all housed in a 9 pin serial port connector. . I use an N29 or N32, optocoupler , diode and resistor.The lines for the PTT go to 1 and 2 on the Codan Microphone plug and the audio in goes to pin 6 with the common (earth/ground) going to pin 7. There is another line that picks external audio and takes it to mike in on the laptop. On both lines of the audio I am using 1 to 1 islolation transformers.with them housed in a small metal container. I heard some one talking the other saying he even earthed the metal box that the iso trans were housed in. Always use shielded cable . All from DSE for under forty dollars and a 250 k round trip. I use a registered version of Chromapix for the analogue side of it and am getting interested in HDSSTV. I will move up the band and conduct tests into my radio shack setup as a SSTV repeater and send pics mobile

Graeme

1787. Translator needed!

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-08-28 10:44:40 UTC
From: bigpauljones
Topic: 1787 Message: 1787

In the beginning God created 493.1 (Kyoto 1978) by means of CCIR

And 493.1 begat the Codan selective calling system - Selcall which gathered many users to the clan Codan because it gave them:-
Robust individual addressing for calling on an HF network.
The possibility of using scanning intelligently by allowing the calling transceiver to stop the called transceiver on an appropriate frequency
The possibility of a mute which only opened when that particular transceiver was called (the first really effective HF mute system)

And Codan was glad to have many users in the southern kingdom

And there were giants in the land at that time and they came to Codan and said "We want to become Giant Users". The first Giant User was Giant Hi Commotion who spread Codan selcall to all corners of his empire. But Giant International became very red and cross and did not want to become a Giant user at this time and neither did Giant Federation. Now Giant Oxford, Giant Food Provider and Giant Childrens' friend became part time users because they were not sure of the son of 493-1

And Codan said unto himself "let us make it possible for User and Giant user to test frequencies before calling his base station" and so he created 99 beacon which gave User:
The possibility for mobiles to determine the best frequency before calling the central station.

And Codan said to himself "it is not good that only one station should be able to respond to a beacon call" and so he created Selective Beacon so that :-
Any station could find the best frequency for contact with any other station by selective beacon calling

And users from the antipodes came before Codan and said "Your users are not happy just talking to other radio users we want to talk to telephone users". And so Codan took Selcall and added Telcall to it because his users cried out to him. Thus :
Automatic radio to telephone and telephone to radio calls could be made using both preset numbers and free dialing.

And the users were content.

Then there were wars and famine and pestilence in the lands and Giant Hi Commotion summoned Codan before him and said "We are a harried and pressed people and do not have time for selcall numbers and frequency choice when disaster strikes and our fingers tremble" And Codan was

greatly troubled by this and summoned his radio blacksmiths to advise him in his southern kingdom. After consulting all the omens Codan added Emergency call to selcall at the behest of Giant Hi Commotion

And so it was that user and giant user could have:-
A single Emergency call button which when pressed for 3 seconds automatically switched to an emergency channel and sent an emergency selcall to the master station.
This resulted in alarm signals over the frequency and in the master station to summon help and a display on the radio to show who was in trouble and on which channel they could be called.
At this time Codan also started the rites of selcall lockout and auto antenna tune for the good of the many.

Now about this time there was a softening of many hearts amongst the Giants. Giants International and Federation although still red and cross, believed Codan's message of user service and became Giant Users. Further Giant food provider, Giant Child Friend, Giant Oxford and many other Giants joined the Codan clan. Giants came even from the world of Nonaid like Giant Beepex to swell the Codan clan.

And Codan said to himself "truly such ingathering of the tribes and loyalty deserves new revelation". So he set himself and the radio blacksmiths a mighty task to allow users to send written messages using selcall and to tell other users where they were without speaking. Thus it was as the millennium drew to a close that Codan users could :-
Send & receive 64 character paging messages with confirmation of arrival error free.
Send and receive GPS position reports.

And user and giant user alike rose up and pronounced it a marvelous thing that Codan had done

But Codan could not rest from his labours for some users had come to him in dead of night and whispered "how shall we know if another users radio is working well" and so spurred on by this challenge Codan took Selcall one last time and fashioned it into status call that the user might know how fared his friend's radio in the storms of life without having to ask him, by providing :-
Diagnostic call to know the state of the radio.
Configuration call to know how the radio is set up.
and User call to command things to happen at another site.

And user and giant user said unto Codan "truly you have provided us with a wealth of features beyond our dreams and imagination. How can we thank you"

Codan said to them "Go forth and communicate throughout the world, multiply users wherever you find need and I will be content"

1788. Option A is now available for NGT in Beta version

Leon, unless you get lucky you may find an actual manual difficult to find. Most of us hang on to them as they aren't easy to find. (Plus they aren't cheap).
If you're having problems working the beast or a maintainace problem then posting here usually helps.
Otherwise good luck :)

Cheers
Jim

And 493.1 begat the Codan selective calling system - Selcall which gathered many users to the clan Codan because it gave them:-
Robust individual addressing for calling on an HF network.
The possibility of using scanning intelligently by allowing the calling transceiver to stop the called transceiver on an appropriate frequency
The possibility of a mute which only opened when that particular transceiver was called (the first really effective HF mute system)

And Codan was glad to have many users in the southern kingdom

And there were giants in the land at that time and they came to Codan and said "We want to become Giant Users". The first Giant User was Giant Hi Commotion who spread Codan selcall to all corners of his empire. But Giant International became very red and cross and did not want to become a Giant user at this time and neither did Giant Federation. Now Giant Oxford, Giant Food Provider and Giant Childrens' friend became part time users because they were not sure of the son of 493-1

And Codan said unto himself "let us make it possible for User and Giant user to test frequencies before calling his base station" and so he created 99 beacon which gave User:
The possibility for mobiles to determine the best frequency before calling the central station.

And Codan said to himself "it is not good that only one station should be able to respond to a beacon call" and so he created Selective Beacon so that :-
Any station could find the best frequency for contact with any other station by selective beacon calling

And users from the antipodes came before Codan and said "Your users are not happy just talking to other radio users we want to talk to telephone users". And so Codan took Selcall and added Telcall to it because his users cried out to him. Thus :
Automatic radio to telephone and telephone to radio calls could be made using both preset numbers and free dialing.

And the users were content.

Then there were wars and famine and pestilence in the lands and Giant Hi Commotion summoned Codan before him and said "We are a harried and pressed people and do not have time for selcall numbers and frequency choice when disaster strikes and our fingers tremble" And Codan was greatly troubled by this and summoned his radio blacksmiths to advise him in his southern kingdom. After consulting all the omens Codan added Emergency call to selcall at the behest of Giant Hi Commotion

And so it was that user and giant user could have:-
A single Emergency call button which when pressed for 3 seconds automatically switched to an emergency channel and sent an emergency selcall to the master station.
This resulted in alarm signals over the frequency and in the master station to summon help and a display on the radio to show who was in trouble and on which channel they could be called.
At this time Codan also started the rites of selcall lockout and auto antenna tune for the good of the many.

Now about this time there was a softening of many hearts amongst the Giants. Giants International and Federation although still red and cross, believed Codan's message of user service and became Giant Users. Further Giant food provider, Giant Child Friend, Giant Oxford and many other Giants joined the Codan clan. Giants came even from the world of Nonaid like Giant Beepex to swell the Codan clan.

And Codan said to himself "truly such ingathering of the tribes and loyalty deserves new revelation". So he set himself and the radio blacksmiths a mighty task to allow users to send written messages using selcall and to tell other users where they were without speaking. Thus it was as the millennium drew to a close that Codan users could :-
Send & receive 64 character paging messages with confirmation of

arrival error free.
Send and receive GPS position reports.

And user and giant user alike rose up and pronounced it a marvelous thing that Codan had done

But Codan could not rest from his labours for some users had come to him in dead of night and whispered "how shall we know if another users radio is working well" and so spurred on by this challenge Codan took Selcall one last time and fashioned it into status call that the user might know how fared his friend's radio in the storms of life without having to ask him, by providing :-
Diagnostic call to know the state of the radio.
Configuration call to know how the radio is set up.
and User call to command things to happen at another site.

And user and giant user said unto Codan "truly you have provided us with a wealth of features beyond our dreams and imagination. How can we thank you"

Codan said to them "Go forth and communicate throughout the world, multiply users wherever you find need and I will be content"

And where do we get the option A for the 9323's ? :))

Cheers
Jim

1792. More freqs

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-08-29 12:42:23 UTC
From: Matt
Topic: 1792 Message: 1792

Evening all, I am writing up a list of freqs in order to get an eprom programmed for 8528 radios, as such I am looking for some more freqs to put into my list.
Currently I have the following freqs for programming 8525's, as can be seen there are still a couple of channels free which I would like to fill - and I also need to get some 8528 chips done as well, so there are a damn sight more gaps that I would like to fill with freqs that are of interest. Any suggestions please??

Matt

1795. Re: [codan_outback_radio] More freqs

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-08-30 01:06:13 UTC
From: Matt
Topic: 1792 Message: 1795

Thanks all for the replies both on and off list. I have also gone through my computer looking for additional freqs, and I will be putting in some NPWS, some military ones, probably police and some more SES and similar freqs. For the 8528, CB will of course be put in there.

Matt

Matt
what about CB freqs, for the 8528 at least.

> Evening all, I am writing up a list of freqs in order to get an eprom programmed for 8528 radios, as such I am looking for some more freqs to put into my list.
> Currently I have the following freqs for programming 8525's, as can be seen there are still a couple of channels free which I would like to fill - and I also need to get some 8528 chips done as well, so there are a damn sight more gaps that I would like to fill with freqs that are of interest. Any suggestions please??

Hello all. What would be the price range I could expect for an older Codan/Barrett that is at least eprom programmable and can scan? Selcall is optional. I am thinking about a 2nd hf unit to compliment the Kenwood.

Secondly, what would be the best-cheapest alternative for an antenna to do 14mhz/7mhz/2mhz general rx coverage? I tried making a 5mhz wire dipole a few year ago and the bloody thing worked better on 27mhz which I already had antennas for, it even worked on 6m/50mhz.

From: Jim
Topic: 1798 Message: 1798

For those of us who buy and sell the occasional radio (or anything else) on ebay.....buyer beware....I received this tonight

"Sorry to hear about you getting ripped off on ebay.
Let me tell you my story. I almost got ripped off also - I put a bid on a laptop but was not successful. Shortly after I got an email from a person in Melbourne (I'm in Brisbane) offering to sell the same item outside of eBay a bit cheaper, but not outrageously so.
After some negotiating he gave me his phone number and a scan of his dirver's licence. I called the number and he answered. So I was pretty confident I knew his identity.
Well I direct deposited about $3000 and waited ---- nothing came.
Strangely he continued to answer my emails, saying it must have been delayed by the courier etc. Eventually it became clear he had never sent anything and he stopped answering my emails, and the phone.
Luckily his email address was tied to an ADSL Telstra account and so he could not change it easily. So I knew that even though he did not reply to my emails, he probably read them
So I did this
I bought the domain corresponding to his name. (for example if he was joe bloggs, it was www.joebloggs.com
I set up a web site there, which gave a description of his scam.

I also included his photograph, driver's licence, his address, phone number, email address and a map of how to find his house.
On the web-page I set up a guest book so people could leave messages for him to read.
I then sent messages to every newsgroup relating to hackers or fraud I could find, advertising the site.
The site had thousands of hits and hundreds of very angry and threatening messages left on the guestbook.
Within 24 hours he got so scared he repaid every cent INCLUDING my costs (about $70.00) in setting up the web site. I then posted a message on the site, saying the money had been repaid, and removed his personal details.
Well that's how I got my money back from an ebay scammer. His big mistake was to reveal his true identity."
Just an interesting story!

Cheers
Jim

I have a couple of codan 8525A remote radios (with selcall boards) that will shortly be available for $450 + P&P. Radios didn't come to me with the power cable so you would need to get hold of one (about $40 to buy), or modify the connection, and do not have antennas. The radios appear to be in good working order, and will be sold as is, although they will have an eprom which will have the usual HF freqs.

Topic: 1800 Message: 1800

Speaking of selcall, I wonder how many here are aware that WA (and no doubt others) had their own selcall format for government agencies ? Got a friend with a WA1 selcall in his Interconnect, doesnt seem to work with the Codan selcall.
I guess like some other naieve people I probably didn't really realize that "selcalls ain't selcalls, Solly !" :))
Cheers

Greetings to all in the group.

I own a Perth Comms HF 106 radio, & would like to know if there is
any info about these sets on the web - perhaps another group ?

Another remote head would be nice to have, but I think they are
pretty rare items.

I bought the set new about 13 years ago, it has performed faultlessly
since, easy to use & compact as well. Pity the company was bought out
by Codan..... but that's business.

Cheers from neil

Hi Niel. I had seen the Perth Comms units on the web from time to time. They looked exactly as you described, and from what I read were in use by a lot of local council/govt mobs at one time. I guess we could almost call them Codans :)) Got any pix, specs , info for the groups archieves ? I'm sure that I'm not the only one unfamiliar with these fine radios. Also have you tried Peter Stevens, he nay have or know of another head for one. I think he's away at the moment but his address is spectech@...

Cheers
Jim

hi there
As i'am new to hf radio / i download a file from this site.
on all the rfds channels and i notice that freq 2020 is a rfds
outpost chat channel/ does that mean i can talk no-emergency chat or
what. As i said iam a novice at this, so i dont want to upset
anybody. could somebody explaind.

appreciated leon

leon
what that means is that 2020 is set aside for LICENSED OUTPOSTS to chat amongst themselves during quiet times (non scheduled broadcasts etc) As that frequency doesnt carry very far, relatively speaking, it is most suitable. I know it also to be used for outback clinics/police to talk to the RFDS plane when it is landing time.
If you want to use HF for general chat etc, join one of the networks available such as Bush Telegraph or VKS737. If you join the RFDS Outback travellers club which is $33 a year, you get bush telegraph membership thrown in.
A couple of sites to do some further reading are
http://ozradio.wireless.org.au/codan.htm
and
http://home.iprimus.com.au/jimshire/

www.flyingdoctor.net/central has info on the RFDS travellers club
cheers

1811. 6924 mute boards

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-09-01 13:08:02 UTC
From: Jim
Topic: 1811 Message: 1811

Guys I've contacted a commercial board manufacturer who is a mate and asked how much to produce a board from the circuit. Anyone interested can contact me. Just costing at this stage.
Idea is to see how cheap we could get a suitable board made so its just a matter of whacking on the bits. Pity I cant do the same with a selcall unit :(
Cheers
Jim

We will offer Option A as a "no charge" option on NGTs, as of today.

The option will allow transceiver operation in all of the amateur bands, as well as selecting sidebands.

We require that you will sight the operator's certificate of proficiency before enabling the option, if you are not sure of their status.

There are a couple of caveats, of course:

1. The option has not been released officially (will be towards the end of the year), so is not supported.

It is the beta version that some of us have been testing for some months, appears stable, but we cannot guarantee it.

2. NGTs will *not* leave the factory with the option enabled, until the official signing-off of beta status.

You will need to give us the RF Unit Electronic Serial Number of the radio, so that we may generate a password to enable the option.

3. NGTs (of whatever model and build) will need v3.14 firmware for the junction box, and v3.11 for the RF unit.

All NGTs may be upgraded to Option A if the firmware is upgraded.

The upgrade price of the labour is completely up to you, and we will supply the firmware to you at no charge if you need it.

It is a couple of MB in size, so I suggest that you ask for a CD to be sent to you if you do not have a broadband connection.

4. We will *absolutely not* provide anyone with passwords to enable Option TXE (front-panel programming of transmit frequencies) on any Codan radio.

This is in clear breach of ACA regulations, and Codan staff are forbidden to supply this option in Australia.

In any event, Option A should obviate the need for this.

Cheers,

Does anyone know how these "passwords" work? I understand it has something to do with the ESN in the radio as stated below, or does it? Could this simply be that Codan then have a record of what your radio is capable of doing, and they have a single code to release a certain option across the range. I remember someone asking about getting the code to unlock the GPS option on, I think a 9323 a while back and Codan wanted some ridiculous amount of money, just to provide the code to punch into the radio. Surely this would be a real mongrel for Codan to have a list of every option unlock code for every radio they ship, if it was all dependant on the ESN in the radio.

Any clues?

Brian.

Speculations: I don't know *how* it works but this *might* be one way....

AN ESN based CRC/Checksum/Encryption algorithm is applied against the activation key.
Such an algorithm would check an encrypted activation code against some iteration of the ESN
and then feed a resulting cleartext option code to the ROS to enable the option. There's probably some
error or counterfeit key checking on the actual code as well, and perhaps a limit to the number of
times you can enter the option key unsuccessfully without disabling the radio to prevent a 'brute force' attack.
Depends how hard they want to make it for a hacker. The encryption could be anything from a simple
check sum or cyclic redundancy check to a PGP or Blowfish encryption.

Further Speculation: Codan have a 'key generator' that emulates this function in the radio, but
in reverse, they feed it an option code, the key gen calculates the activation code for
any ESN that they enter using the same algorithim as the radio.
The code will then only work on a radio with that ESN.

Sooner or later, someone will reverse engineer the ROS and find out
how it's done. This sort of thing is like copy protection on software. It only keeps
unskilled and/or honest people out. The only reason it might not happen is not because it can't be done
but someone with the necessary skills hasn't had the incentive to do so. That said, it's *not* like

hacking windows - it's firmware in something physical - it's unlikely to be impossible but it would certainly be difficult, especially if they 'booby trap' the ROS to disable the radio if too many bogus codes get entered. I'm a little surprised someone hasn't done it to the
8525 or 8528 series. Again it probably comes down to someone with the necessary skills not having a radio, or if they do, not having a need to do so and/or just can't be bothered.

Incentive combined with the necessary skills is the key issue.

I'm not advocating such activity, but hacking of such things is possible. Personally I consider charging *ridiculous*
prices for options that are present in the radio and just require a key to be blatant gouging and quite immoral.
But that's just my opinion. Codan's incentive is probably how much profit they can realise on each unit sold and
such 'options' are sellable with virtually no costs involved.

That said, they make a good product, none better in my opinion, I'm just a little saddened that they take
this particular tack with soft options. I do note however that they have just made the Amateur Band option on the NGT series a
freebie, so they will act in the public interest, something that they do have a history of doing. Well done to them for doing that.

Fair enough, I have no wish to start or participate in a flame war. It was simply
an aside to a technical question.

I did also say that the recent move to make the Amateur option for the NGT
was a very positive move and something for which they are to be commended.
I *still* believe they make the best HF gear in the known universe, prices for
options notwithstanding.

Verbum sap.

Geoff,

Sorry, but I am in the software industry, and have seen good companies go under when they did not get the proper return on investment for their development costs.

It's just that it's a personal sore point, and I tend to react too quickly :-(

That said, how do I justify an NGT just for Option A?

Easy - sold the 9323 this morning!!!!!!

Martin

Understand where you are coming from. The more knowledgeable may
be able to correct me if I'm wrong, but I suspect that the ROS is a relatively
small part of the R&D costs for the radios.

I'm think I'm going to have a long hard look at my 8525A and see what it can or can't
be re-educated to do, software wise.

> It's just that it's a personal sore point, and I tend to react too

No problems. As I said, it was just an aside to a question about how the
option codes worked.

> That said, how do I justify an NGT just for Option A?
>
> Easy - sold the 9323 this morning!!!!!!

Well, that's one good reason. Codan make bloody good radios, a lot of their
older stuff is still working after bashing around the scrub in old Landies and the
like for literally years, in blistering heat and freezing cold. I'm not sure how many
miles my 7727 R/H units have done but it would be a hell of a lot.

Not sure - my 8528 in the car has a different fastening mechanism to the 8525 bracket that I picked up recently. My 8528 bracket has a couple of wire clips that fastens the radio into the bracket, whereas the 8525 has a couple of rotating lugs that you turn with a screwdriver to lock it in. Maybe I just have a weird bracket.

You have an example of the two types of mounting cradle available. The standard one has the two roatating lugs and you slide the radio in. You need to have a lot of space around the radio to use this setup.
The second bracket is known as a 'top mount' cradle as you virtually only need the space taken by the radio to install it in the cradle. Not a common cradle setup, but very handy when its needed.
Ben

OK - I find that the rotating lugs is a better setup, although having said that, where I have the 8528 mounted in the cruiser (under a false floor covering the back seat), it is probably more convenient than the more conventional rotating lug setup (still a bastard to get in and out though).
Thanks for the information deconfliction.

Matt

Matt
You have an example of the two types of mounting cradle available. The standard one has the two roatating lugs and you slide the radio in. You need to have a lot of space around the radio to use this setup.
The second bracket is known as a 'top mount' cradle as you virtually only need the space taken by the radio to install it in the cradle. Not a common cradle setup, but very handy when its needed.
Ben

Matt wrote:
>
> Not sure - my 8528 in the car has a different fastening mechanism to the 8525 bracket that I picked up recently. My 8528 bracket has a couple of wire clips that fastens the radio into the bracket, whereas the 8525 has a couple of rotating lugs that you turn with a screwdriver to lock it in. Maybe I just have a weird bracket.

Leon , to pinch an expression (and also to butcher it), you can mount it any which way but loose :) I'm assuming your referring to the set and not the aerial.

Cheers
Jim

David
The only info I have is here
http://ozradio.wireless.org.au/9323.htm
They are basically a rebadged 8528 that is PC programmable with less channels (15). The circuits are pretty much identical, except for the addition of programming facility. I know one of the boards inside is different to most 8528's but is the same as the very last of the 28 run. A certain IC wasnt available any more was the reason for the change. Me I'd grab it for the right price and see if it can be turned into an 8528 by changing eprom.
There was a 28 control head on ebay a few days ago, not sure if its still there.

Jims site has recent auction prices on ebay etc as a guide..
http://home.iprimus.com.au/jimshire/

cheers
Ben

1843. programming NGT

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-09-06 11:00:34 UTC
From: drbrucethorpe
Topic: 1843 Message: 1843

I just bought a second hand NGT to use as a home base, to communicate with the 9323 in my car. The NGT lacks some of the channels on the 9323. My nearest codan dealer is hundreds of kms away - I live in Fitzroy Crossing, W.A.

1. - Is there a way of 'jumping' the NGT on startup to enable programming in the way you can with the 9323.

2. - the codan NSP software for programming the NGT, like the XP software for programming the 9323 is prohibitively expensive. I understand the medical aide organisation MSF created their own software for the NGT - does anyone know about this? Is it available?

thanks!

1845. codan 9313 - the bit I found out!!

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-09-07 02:07:59 UTC
From: Stuart Mitchell
Topic: 1845 Message: 1845

Frank,
As I understand it, Codan 9313 has an international equivilant badged Codan 9480.
However, the 9480 is not telcall capable but it can be made telcall capable by changing the radio's internal firmware which I assume just turns it into a 9313 which then enables telcall, selcall RFDS emergency calling etc.....Remember this is all coming from a bit of a "bunny".....but I did look seriously into buying a 9480 before I was lucky enough to pick up an 8528.
The cost of the conversion is around $130 AUS including channel programming + freight to and from Brisbane.
I did find a source of 9480's (several 20 ??) in Geneva that were quoted to me at 400 swiss francs (couple of months ago). The guy who has them is Agatino Lucifora alfito_1999@... .
I did "move coal to Newcastle" and have bought a few Codan bits off this guy recently.
Hope all this rambling helps a bit.

Ben thanks for that info.
I have now obtained the 9313 along with 8558 auto tune and 8551 interface. Do you have any sugestions as to how I can get hold of a copy of the operating manual and information on how to program the frequencies
How relevant would the 8528 manual be?

Stuart,

Thanks very much for your response. You mention that you were "lucky enough to pick up a 8528". Does this mean you consider this model better than the 9313 & 9480.
Thanks again.
Frank.

1848. Installing a 9323

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-09-08 12:56:41 UTC
From: John D
Topic: 1848 Message: 1848

I am about to install a 9323 into my GU Nissan Patrol.
I don't really want to spend $400 on an overhead console if I can help it.
Where would be the preferred location be for the remote head, and what are
the things to look out for ? I was looking at the area just in front of the
rear view mirror. Is it possible to run the cable over the headlining?
I believe the aerial must go on the back of the vehicle these days, and for
that I am buying or making a bracket to fit on the spare tyre mount. What
would be the best way to run the cables into the vehicle?
I am looking at putting the main transceiver unit under the passenger seat.

All input much appreciated.
John

John
One of the 4wd mobs make a bracket to suit, its a bit better than the ones in the photos.
To run the cables to the rear, run them up the drivers side rear trim to the jack/tool holder area. Cut a slit in the rubber cable cover between the body and the door and feed the cables from the tool area out the slit. Then remove the plastic hinge cover on the door, notch out a slot in the bottom and bring out the cables. Seal up the slit in the rubber boot with self vulcanising tape (or silastic at a pinch) and tidy everything up with cable ties.
A quick way to run the cable under the rear cargo area trim is to drill a 1 inch hole in the trim just behind the back seat level with the rear floor height, poke a stiff bit of wire through until it comes out in the jack/tool area. It looks neat, but I dont really know if I'd drill as many holes in my own car as a company one!!
As far as the control head goes, about the best spot is under the centre instruments. This is better in an auto of course, The head is obscured a bit in a manual in 5th gear..
Definately steer clear of the overhead consoles. You will learn many new words trying to install cables to them, and in the unfortunate event you roll the vehicle, you are guaranteed to hit your head on it, not to mention trying to twist your neck off to see it. Make it accessable for the other half to use it too, and teach her, you never know...
I would try to find a better spot to mount the transceiver than under the front seat. First decent water you drive through will blow out the plugs in the floor and make the under carpet wet. Years of experience speaking here. On the cargo barrier if you have one is best, or on its side in the rear area, or under the rear kiddy seat if fitted would be better.
Run the DC cable up the passenger side, There is a large grommet in the engine bay that you can slit to run the cable through with minimal effort.
Cheers
Ben

And when you consider the investment in test equipment and expertise necessary to fix them, they are relatively cheap to fix should anything ever need doing. (But being a Codan that shouldnt happen too soon :). The equipment necessary to do an even modest fix on these tranceivers can easily run into 100K.

Hi Jim - thanks!

Geike Gorge - as beautiful as ever. I frequent the river - kayaking, barra fishing and pig shooting - especially now with 6 months long service leave!

The rangers at the gorge enforce strict rules w.r.t. boats - you can only put in or pull out before 7.30 and after 5.00 - that's OK for a motor boat, but in the kayak I would be overloaded with water and provisions - so I tend to go to parts of the river which are not controlled - there are many just as beautiful.

We still take our visitors to the gorge however!

Regards, bruce.

From: Jim
Topic: 1843 Message: 1854

I have very fond memories of that place. The town less so, although I'm sure it's a very different place now. Only been through twice, 5 years apart and we saw huge differences.

Passed your email along to a friend who's a 4wding medico with a lot of contacts. He confirmed who MSF are (ah duh Jim :) and asked if you'd tried asking them? He's got a lot of worldwide contacts in the med scene but none in MSF strangely.....but there again he IS a pathologist :))

Codan are very protective of the copyrights on their software for many reasons. I'd be surprised if you could satisfy your needs locally without sending the gear to a dealer. Understand that in your position this isn't the easy option. I doubt that its the only "not easy" problem you encounter living there :))
Sorry I couldnt be of more help.
Cheers
Jim

Hi Jim - thanks!

Geike Gorge - as beautiful as ever. I frequent the river - kayaking, barra fishing and pig shooting - especially now with 6 months long service leave!

The rangers at the gorge enforce strict rules w.r.t. boats - you can only put in or pull out before 7.30 and after 5.00 - that's OK for a motor boat, but in the kayak I would be overloaded with water and provisions - so I tend to go to parts of the river which are not controlled - there are many just as beautiful.

We still take our visitors to the gorge however!

Regards, bruce.

Bruce and Cathy Thorpe
Fitzroy Crossing, West Australia

Subject: [codan_outback_radio] programming NGT

I just bought a second hand NGT to use as a home base, to communicate with the 9323 in my car. The NGT lacks some of the channels on the 9323. My nearest codan dealer is hundreds of kms away - I live in Fitzroy Crossing, W.A.

1. - Is there a way of 'jumping' the NGT on startup to enable programming in the way you can with the 9323.

2. - the codan NSP software for programming the NGT, like the XP software for programming the 9323 is prohibitively expensive. I understand the medical aide organisation MSF created their own software for the NGT - does anyone know about this? Is it available?

thanks!

1855. 6924 mute boards

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-09-11 01:33:12 UTC
From: Jim
Topic: 1811 Message: 1855

The quote for pcb's for the mute boards for the 6924's is in, comes in at around $10 ea for the board. Told my manufacturer that I'd get back to him when I knew of any definite interest. I'm not sure if it might be worthwhile getting him to just supply the whole thing ready to go. Any comments ?
Cheers
Jim

From: Jim
Topic: 1811 Message: 1859

Hi Malcolm, well that would be great if we could actually get hold of the appropriate board/boards/ thumbswitches etc. Got a feeling this would be expensive and difficult. However I did hear about some "black faced" 6924's with selcall and the thumbswitches on the front...I'm chasing them at the moment.
Cheers

1860. 6924 mute boards "complete"

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-09-11 09:23:23 UTC
From: Jim
Topic: 1860 Message: 1860

Got a quote on the boards as previously posted or complete units. ie board as per Malcolms info , made up and ready to be mounted and connected. Remember you'd need to drill a hole in the front panel and provide your own on/off switch. (Challenging huh).
I have a price of $35 ea for these but I have to buy 10. Have already had expressions of interest for 3 or 4, and much as I like the idea I dont want to have to invest $350 and have em in the shed.
Told the guy I'll get back to him tomorrow.

Cheers
Jim

Hello group. Last posting for these Codan items :

2 Codan 8528 base stations (99 channels)

1 remote head for 8528 (8531,with speaker included)

about 20 Codan 9480 (15 channels)

about 50 Codan 8551 control boxes (for 8558 antenna)

about 15 Codan X2 (10 channels)

(about 10 Icom 700ty 16 channels x 3)

Cost is not really the issue - availability is the key. If you find some hens teeth, and some rocking horse shit, you may just be lucky to come across someone selling off their 8528 head.
Seriously though, they are in very short supply, and command a high price when you can find them.

Matt

Hi Vic

I hope you are correct - that would make things easier - any ideas on the location of the link?? - the owners manual makes no mention other than front programming of Rx only. It says hardwire programming (presumably by eprom) is done under "technician supervision" which I guess is a euphamism for "take it to a dealer"!!\

Cheers Larry

Hi Larry,
The link you are looking for is in the control head.

There are three links with removeable shorting plugs the manual will
tell you what the other two are for follow your nose from there.
Mike

1872. 9330 control head

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-09-14 09:20:37 UTC
From: Nigel
Topic: 1872 Message: 1872

Hi all,

after too much abuse my 9330 died...

where's the best place to get one new or secondhand?

I'm gonna take it the local radio shop for a repair quote
but would like to have some replacement prices to compare.

Cheers

Nigel

From: Jim
Topic: 1874 Message: 1874

Have just been informed that you can now get your emails wherever you roam in Oz by using Radiodata, the other bit of Bush Telegraph. Havent checked them out yet, wonder how fast the speed is :(
Just think, now you can have in the bush what you were trying to get away from :) Personally I rekkon that you have the option of doing it, its not compulsary so probably a great service. If anyone wants to know more check out www.reidsradiodata.com.au
Just turn on the old Codan and a mess of lectronics and there ya go, instant spam for dinner :)
Cheers
Jim

1875. Re: [codan_outback_radio] Re: Barrett 250 software / service manual

Yahoo group: codan_outback_radio (1997 — 2004)

From: Larry
Topic: 1864 Message: 1875

Thanks Mike - unfortunately I have the local control version so no control head - the only links I can find are on the front panel controller board J1 & J2 -
the users manual indicates that J1 is for the auto-tune option (not fitted) and enabling it disables the quick channel select buttons on front panel - I have verified that indeed is the case. Thinking that J2 may be the "programming" link I removed the shorting plug with no joy. The membrane keypad appeared to be a bit dodgy on the "prog" key so I decided to investigate further and lo and behold the plastic multi strand ribbon cable connecting the membrane to the controller board fell out of its header which is soldered to the controller board - so now I have to replace this ribbon with something more substantial (a job I am not looking forward to as it is one of those thin flat clear ribbon cables) and try again - but I will perservere and keep you (and anyone else interested) posted.

Cheers Larry

Larry,
The links on th rc model are side by side one for auto tune, one for marine version(activates the 2182 button) and the other for programing, not sure on the local version i thought it was the same, will be interesting to see what happens when the ribon cable is fixed.
Mike

1878. 9350 auto tune

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-09-15 11:49:41 UTC
From: Dale Caterson
Topic: 1878 Message: 1878

The control plug on the autotune was damaged by moving steel pole - wife swears 80s was stationary. It is only the plug attached to the cable that is damaged where can I get a new plug and is it a soldered or a crimp connection. I am located in Sydney.

Ooooh nasty - they are not cheap. I am not familiar with Sydney codan shops, so hopefully the Sydney natives here will be able to help you - or alternatively have a look on the codan site and see if there are any dealers listed for the Sydney area. I think the plugs are solder rather than crimp on - the vibrations experienced by the antenna would surely shake a crimped on connector in no time flat.

Matt

Dale
The plugs are soldered on. Once you do one, you'll swear black and blue
not to do another. If you cant find a 2nd hand cable or a damaged one to
salvage the plug the best bet is a new cable. The only place I have
found that sells the plug is Farnell. The price is dearer than a new
cable from Codan. Last time I priced a cable it was around $65.
cheers
Ben

1882. Mounting an Aerial - still

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-09-16 02:11:47 UTC
From: John D
Topic: 1882 Message: 1882

I haven't found a satisfactory way to mount an Autotune to the back of my GU Patrol. It either leaves the base very vulnarable to branches etc, or it requires the aerial to be removed when needing the spare.
Question :
If the tuner section aerial is mounted on the base of the bullbar, with the bottom of the spring level with the bonnet, would the efficiency of the aerial be affected?
According to the RTA (NSW) information on their website, this would not be illegal (in NSW anyway)
John

John, there will be some detuning effect and there may well be a reduction in radiation effeciency but depending upon how far away from the metal the aerial is these shouldnt post too many problems. Thats assuming that you're mounting it on the outside not between the bar and the bonnet.
Cheers
Jim

Jim, knowing your Bull bar restrictions and standards over there wouldn't putting it on the outside be classed as forward mounted with dangerous sharp edges??? Our standards are based on yours and our testing stations probably wouldn't accept it. Your thoughts???

Thanks Jim,
To mount the aerial on the outside (in front of) of the bullbar seems to be illegal. http://www.rta.nsw.gov.au/registration/vehiclestandards/index.html

I was thinking about mounting it between the bar and the bonnet.
Looks like I will be stuck with a rear mount by the looks :(

Malcolm, yes and no. If it doesn't protrude in front of the bar then QLD police usually turn a blind eye at the moment. Of course not if you persist in swanning around the centre of Brisbane I'd imagine. NSW however have Mr Dillpickle (No bullbars no 4wds no brains) jumping up and down and the regs tend to be a little harsher in terms of enforcement. However you will spot a lot of Govt 4wds with them on the front. I understand this is to change. WA has a straight "put em on the rear" policy as I understand it.
So John would be better to put it on the rear. I'd put mine there too but its too hard to see the bloomin floros and branches. Might distract me and cause an accident :))

Cheers
Jim

Jim
the reason you see antennas still on the front of Govt vehicles is that emergency services (ambulance, fire, police, rescue, ses) have an exemption under the act. The others get away with it because in large they dont go anywhere near the city and are genuinely needed. (how often does the teachers car at Tibooburra get to Sydney????) I still wouldnt' like to sort out the legal mess if something went wrong.
When I get back to work I will chase up the supplier of rear mount brackets and post it here along with some photos.
As far as projections on bars go it remains open to interpretation by the bloke in blue you talk to. A highway patrol friend here said my driving lights that clearly stick out of my bullbar are OK because there are no sharp or jagged edges for a pedestrian to catch on.
Best bet is to stick it on the rear and save the hassle, OR buy a troopy, all the bars on those I see have at least 20cm between the bonnet and the bullbar!
Ben

Jim,
Yup,
That's about it. I have a base loaded antenna at the moment with a relay to short the base loading coil for the high frequency, its mounted on the rear, mounted it directly to the rear door panel beside the spare wheel. Works fine there. Hoping to replace it with an auto tune soon so will prob have to go thru the same exercise. It may well end up on the antenna mounting bracket on my TJM bar though..... :-))

Malcolm, yes and no. If it doesn't protrude in front of the bar then QLD police usually turn a blind eye at the moment. Of course not if you persist in swanning around the centre of Brisbane I'd imagine. NSW however have Mr Dillpickle (No bullbars no 4wds no brains) jumping up and down and the regs tend to be a little harsher in terms of enforcement. However you will spot a lot of Govt 4wds with them on the front. I understand this is to change. WA has a straight "put em on the rear" policy as I understand it.
So John would be better to put it on the rear. I'd put mine there too but its too hard to see the bloomin floros and branches. Might distract me and cause an accident :))

Cheers
Jim

Jim, knowing your Bull bar restrictions and standards over there wouldn't putting it on the outside be classed as forward mounted with dangerous sharp edges??? Our standards are based

on yours and our testing stations probably wouldn't accept it. Your thoughts???

John, there will be some detuning effect and there may well be a reduction in radiation effeciency but depending upon how far away from the metal the aerial is these shouldnt post too many problems. Thats assuming that you're mounting it on the outside not between the bar and the bonnet.
Cheers
Jim

I haven't found a satisfactory way to mount an Autotune to the back of my GU Patrol. It either leaves the base very vulnarable to branches etc, or it requires the aerial to be removed when needing the spare.
Question :
If the tuner section aerial is mounted on the base of the bullbar, with the bottom of the spring level with the bonnet, would the efficiency of the aerial be affected?
According to the RTA (NSW) information on their website, this would not be illegal (in NSW anyway)
John

Ben, the problem with those Troopy bars is that under NSW and Vic legislation, many of them are illegal as I understand it. I know there have been recent changes in Legislation and design rules for bars, I think someone mentioned that in one part of QLD they were trying to replace the police ones with the plastic ones.

Cheers

Jim
the reason you see antennas still on the front of Govt vehicles is that emergency services (ambulance, fire, police, rescue, ses) have an exemption under the act. The others get away with it because in large they dont go anywhere near the city and are genuinely needed. (how often does the teachers car at Tibooburra get to Sydney????) I still wouldnt' like to sort out the legal mess if something went wrong.
When I get back to work I will chase up the supplier of rear mount brackets and post it here along with some photos.
As far as projections on bars go it remains open to interpretation by the bloke in blue you talk to. A highway patrol friend here said my driving lights that clearly stick out of my bullbar are OK because there are no sharp or jagged edges for a pedestrian to catch on.
Best bet is to stick it on the rear and save the hassle, OR buy a troopy, all the bars on those I see have at least 20cm between the bonnet and the bullbar!
Ben

Jim
the reason you see antennas still on the front of Govt vehicles is that emergency services (ambulance, fire, police, rescue, ses) have an exemption under the act. The others get away with it because in large they dont go anywhere near the city and are genuinely needed. (how often does the teachers car at Tibooburra get to Sydney????) I still wouldnt' like to sort out the legal mess if something went wrong.
When I get back to work I will chase up the supplier of rear mount brackets and post it here along with some photos.
As far as projections on bars go it remains open to interpretation by the bloke in blue you talk to. A highway patrol friend here said my driving lights that clearly stick out of my bullbar are OK because there are no sharp or jagged edges for a pedestrian to catch on.
Best bet is to stick it on the rear and save the hassle, OR buy a troopy, all the bars on those I see have at least 20cm between the bonnet and the bullbar!
Ben

1894. RE: [codan_outback_radio] Mounting an Aerial - still

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-09-16 04:19:40 UTC
From: Bruce Thorpe
Topic: 1882 Message: 1894

The company Kaymar - they make swing-away rear wheel carriers for 4WDs - make two types of HF mounts to suit their product. The link is...
http://www.kaymar.com.au/jeepcher_pspare.html

I have one of these wheel mounts on my Landrover Defender which does 90% of its work off road. It has stood up to 7 years of this elegantly.

I still have my 9350 mounted anteriorly on the bull bar. So do all of our hospital 4WDs, so do our police 4WDs, though the police sedan has it mounted on the tow bar.

Are the regs different here in the west, or is it just that no-one worries about it in remote areas like this?

Bruce.

Bruce, as I understand it the rules are made by the states (as the moment !) ! Not sure where your mob stand but I was assured that WA did not permit vehicles to be registered with the autotune on the front.
The Kaymars are good but you need to buy a rear carrier to mount the HF :))
Cheers

Probably pay for it in one antenna mount construction (unless you already have a kaymar bar - in which case you are broke & cant afford the radio nto start with).

Dave

Jim <jimshire@...> wrote:
Bruce, as I understand it the rules are made by the states (as the moment !) ! Not sure where your mob stand but I was assured that WA did not permit vehicles to be registered with the autotune on the front.
The Kaymars are good but you need to buy a rear carrier to mount the HF :))

The company Kaymar - they make swing-away rear wheel carriers for 4WDs - make two types of HF mounts to suit their product. The link is...
http://www.kaymar.com.au/jeepcher_pspare.html

I have one of these wheel mounts on my Landrover Defender which does 90% of its work off road. It has stood up to 7 years of this elegantly.

I still have my 9350 mounted anteriorly on the bull bar. So do all of our hospital 4WDs, so do our police 4WDs, though the police sedan has it mounted on the tow bar.

Are the regs different here in the west, or is it just that no-one worries about it in remote areas like this?

Bruce.

Jim
the reason you see antennas still on the front of Govt vehicles is
that
emergency services (ambulance, fire, police, rescue, ses) have an
exemption under the act. The others get away with it because in
large
they dont go anywhere near the city and are genuinely needed. (how
often
does the teachers car at Tibooburra get to Sydney????) I still
wouldnt'
like to sort out the legal mess if something went wrong.
When I get back to work I will chase up the supplier of rear mount
brackets and post it here along with some photos.
As far as projections on bars go it remains open to interpretation

by
the bloke in blue you talk to. A highway patrol friend here said
my
driving lights that clearly stick out of my bullbar are OK because
there
are no sharp or jagged edges for a pedestrian to catch on.
Best bet is to stick it on the rear and save the hassle, OR buy a
troopy, all the bars on those I see have at least 20cm between the
bonnet and the bullbar!
Ben

Jim wrote:
>
> Malcolm, yes and no. If it doesn't protrude in front of the bar
then QLD police usually turn a blind eye at the moment. Of course not
if you persist in swanning around the centre of Brisbane I'd imagine.
NSW however have Mr Dillpickle (No bullbars no 4wds no brains) jumping
up and down and the regs tend to be a little harsher in terms of
enforcement. However you will spot a lot of Govt 4wds with them on the
front. I understand this is to change. WA has a straight "put em on the
rear" policy as I understand it.

I have a Codan 9350 autotune on the back of my GU [see http://users.bigpond.net.au/ronshirl/hf.htm]. The top of the autotune is approximately 25cm above the roof and has not been a problem with overhanging branches, so far. Undercover car parks less than 2.2metres must be given a miss.

The reason for my choosing rear mounting I don't think has been mentioned in this discussion, and is covered by Vicroads Road Safety documents Vehicle Standards Information 29 which talks about the "Drivers Field of View Requirements" in respect to aerials.

See http://www.vicroads.vic.gov.au/vrne/vrninte.nsf/LinkView/8D3B6742F1CE6F0CCA256B6D00199302A0E6B550C59A6444204A171BCD2A5F8F

or try http://tinyurl.com/nic3 if the above does not work.

I've run one on the bullbar for 5 years. The vehicle has been driven under all conditions, city traffic, bush tracks, deserts etc . I have never once needed to worry about my vision being obstructed by the aerial. Perhaps its just that I drive carefully and take it into account :))

Cheers

Ron
thats a good bracket, its very similar to the aftermarket ones I
mentioned earlier with the exception of the two stays that come down
onto the wheel holder.

Well Jim, Ben et all, the latest I have of the Queensland legislation "supposedly" meaning the mandatory fitting of plastic bullbars, was originally a "beat up" by the company that supplies the bars (South Australian Based Water Tank maker.). There "Maybe" legislation later on but not now. Also winches can't be fitted as the adapters cost a bit as well as defeating the "soft hit" with a metal fairlead and drum.
We are still getting Hilux's up here supplied from Brisbane fitted with these "U beaut" plastic things though, someone in a glass cubicle hasn't though of what happens when one of them contacts a 1 1/2 tonne bull! Nor what happens when someone throws burning liquid onto the bonnet and bullbar, yes it has happened and whilst the vehicle driver reversed out of the way (At speed!!!) the paint burnt off all the steel but nothing else burned apart from the singed plastic grill, which doesnt burn as easily as polypropelene which is what the plastic bullbars are made of! Fitted up a new Prado today, I pity it as it is going to the same place as the above incident, the whole front is plastic! And no bullbar!
The actual idea behind the plastic bullbar is "It causes less head injuries to pedestrians when they are "Run Down" (hit) by a 4WD fitted with a plastic bullbar." What do they think 4WD owners are, escapies from Mad Max! Mind you any pedestrian hit by a 1 1/2 tonne to 2 odd tonne 4wd is going to have more than head injuries!
A comment by one of our "dry witted" fellows, "How can they tell from the bits recovered from a pedestrian, after they have been run over by a normal sized 4WD (Not a toy Suzuki or AWD Subaru.), if the injuries would have been less if the head had hit a plastic bullbar first. I thought after the bullbar came the front wheels, front diff, gearbox, cross members, transfer case, rear prop shaft, rear diff and wheels. Oh yeah forgot the HD Hayman Reese Towbar at the back and the spare tyre!" makes you think a bit.
We are fitting the 9350 antenna's on the rear cages of the Hilux utes and every 2 or 3 weeks they have to come back in and get the bracket and panelling "Panelbeated straight" again as well as replacing a few whip tops, "If I can't see it, it won't hit anything!" seems to be the attitude. But jeez, the poor antenna's, plus the crews lives may depend on the antenna working in a tough situation! Someone needs to take the do gooder and litigation ambulance chasers out of the equation and put common sense and thought back into legislation.

IMO

Sam

Jim wrote:

>Ben, the problem with those Troopy bars is that under NSW and Vic legislation, many of them are illegal as I understand it. I know there have been recent changes in Legislation and design rules for bars, I think someone mentioned that in one part of QLD they were trying to replace the police ones with the plastic ones.

Dale
The plugs are soldered on. Once you do one, you'll swear black and blue
not to do another. If you cant find a 2nd hand cable or a damaged one to
salvage the plug the best bet is a new cable. The only place I have
found that sells the plug is Farnell. The price is dearer than a new
cable from Codan. Last time I priced a cable it was around $65.
cheers
Ben

Dale Caterson wrote:

With a little bit of thought the kaymar high lift jack bracket can be modified to suit the 9350. to change the spare 3 nuts and 2 plugs to undo about 3minutes max.But come to think of it I have not had a flat in 5 years so it is not a real problem

1909. Fw: [codan_outback_radio] Mounting an Aerial - still

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-09-16 21:25:54 UTC
From: Malcolm at "On- Track 4WD" in Greymouth
Topic: 1909 Message: 1909

I found, on JPG20 on Bens 8558 files page the following about auto antennas.
At the top of the page it says."Base loaded coil occupies top 300 mm of bottom section. Keep clear of bodywork as far as practical."
Further down the page it says, Section 5.1.2. "Where a bull bar is fitted, the 8558 may be mounted behind the bar for added protection, although the best radiation efficiency is obtained with the antenna as high and as clear of the vehicle metal as possible"

Jim,
Yup,
That's about it. I have a base loaded antenna at the moment with a relay to short the base loading coil for the high frequency, its mounted on the rear, mounted it directly to the rear door panel beside the spare wheel. Works fine there. Hoping to replace it with an auto tune soon so will prob have to go thru the same exercise. It may well end up on the antenna mounting bracket on my TJM bar though..... :-))

Malcolm, yes and no. If it doesn't protrude in front of the bar then QLD police usually turn a blind eye at the moment. Of course not if you persist in swanning around the centre of Brisbane I'd imagine. NSW however have Mr Dillpickle (No bullbars no 4wds no brains) jumping up and down and the regs tend to be a little harsher in terms of enforcement. However you will spot a lot of Govt 4wds with them on the front. I understand this is to change. WA has a straight "put em on the rear" policy as I understand it.
So John would be better to put it on the rear. I'd put mine there too but its too hard to see the bloomin floros and branches. Might distract me and cause an accident :))

Cheers
Jim

Jim, knowing your Bull bar restrictions and standards over there wouldn't putting it on the outside be classed as forward mounted with dangerous sharp edges??? Our standards are based on yours and our testing stations probably wouldn't accept it. Your thoughts???

John, there will be some detuning effect and there may well be a reduction in radiation effeciency but depending upon how far away from the metal the aerial is these shouldnt post too many problems. Thats assuming that you're mounting it on the outside not between the bar and the bonnet.
Cheers
Jim

I haven't found a satisfactory way to mount an Autotune to the back of my GU Patrol. It either leaves the base very vulnarable to branches etc, or it requires the aerial to be removed when needing the spare.
Question :
If the tuner section aerial is mounted on the base of the bullbar, with the bottom of the spring level with the bonnet, would the efficiency of the aerial be affected?
According to the RTA (NSW) information on their website, this would not be illegal (in NSW anyway)
John

Topic: 1882 Message: 1910

I tried the link below and various versions of it and couldn't get anything to come up, so I've got no idea what Ron's talking about. I have now posted a few pictures of the back of my Land cruiser in the photos section of the group. The tuner is mounted down reasonably low (Yes I know it's a fair bit below the roofline) and the whip sticks up over the top when it's on. I had the tuner on the bull bar of the Patrol for a while till all my passengers whinged that's all they could see, so I moved it to a bracket I fashioned up for the back of the car (which I can't find photos of at the moment). The old mount was better as the tuner sat just under the roof line of the car, however this will do the job on this car. At least it is legal and I know it doesn't protrude above the roof for when the wife is driving the car, she's already wiped out the cage on the front once :)

I'm sure I also stuck a NSW RTA bulletin in the files section a while ago saying what is and isn't allowed to mounted on the front of cars and bullbars, for those in NSW that want to refer to it.

On the subject of bullbars, on my GQ Patrol there was just enough room to squeeze the HF down in between the car and the bullbar (which I wasn't keen on anyway), but there was plenty of room to mount it right up top, on a bracket I fashioned up and welded on. The Land cruiser is a totally different story though. There is barely enough room to stick my arm down between the bonnet and the bullbar due to the backwards slant on it, and while I haven't tried it I think I would be hard pressed getting the tuner base to mount on the antenna mount on the bullbar and still being able to get the bonnet open, so it looks like the front is an option that just wont happen in the newer cars as they keep producing them.

Brian.

I have a Codan 9350 autotune on the back of my GU [see http://users.bigpond.net.au/ronshirl/hf.htm]. The top of the autotune is approximately 25cm above the roof and has not been a problem with overhanging branches, so far. Undercover car parks less than 2.2metres must be given a miss.

1917. 7727-TB

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-09-19 07:25:13 UTC
From: koogalau
Topic: 1917 Message: 1917

I have just bought a very second-hand 7727-TB for our round Australia trip. From reading through old messages on the board, I know that I may recieve comments about a 7727 being good for a boat anchor, etc but other comments from this site indicate that the radio should be a sound choice for what we wish to do.

It has RFDS frequencies fitted: 2020, 4010, 4055, 5110, 5410 and 6890. I have applied for an outpost radio licence for these.
I will be asking our local radio tech to install 8022 and 5455 and will also join VKS-737 to operate under their licence.

I do have a couple of questions:

I found a copy of the service manual at www.ozradio.wireless.org.au/manuals/7727tsm.pdf but probably need an operators/operations manual to fully appreciate how to work it. Does anyone know of a web address where I can obtain one?

Our car is an old Landrover and, given this week's discussion on antenna/aerial location (is it correctly an antenna or an aerial?), we are thinking of putting a mount for the multi-tap antanna/aerial high on the back above one of the oval windows (and only screw in the antanna/aerial when we are stationary and using the radio). How far from the car body should the springy bit (correct name?) and the base be? Could we simply bolt on a big piece of angle aluminium and use it as a suitable mounting point? Can we put the springy bit and base down below the roofline or must it stick up above the car?

Your advice and serious suggestions are sought.

With thanks,

Koogalau.

1918. Re: [codan_outback_radio] 7727-TB

Yahoo group: codan_outback_radio (1997 — 2004)

From: Malcolm at "On- Track 4WD" in Greymouth
Topic: 1917 Message: 1918

The operating instructions for the 7727 series radio which I give people one of these sets are as below. Hope it helps. I can give it to you in a word format if you email me direct
Basic Operating Instructions Codan 7727/ 8727

1) Switch Transceiver On by rotating the Volume control clockwise. The Power indicator will light.

2) Select the required Channel and ensure that you have the correct antenna fitted. Where used this is 7848 Day Channel 1 & 4946 Night Channel 2

3) With the Mute switch Off, set the Volume control for a comfortable listening level.

4) The Mute will remove background noise when no signals are present and may be switched Off to prevent the occasional loss of syllables when communicating in the presence of weak signals.

5) Hold the Microphone side- on, close to the mouth and speak clearly across it. Take care to press the transmit button on the microphone BEFORE speaking. ALWAYS listen before transmitting to ensure that your channel is free of traffic.

6) When transmitting the Transmit indicator will flicker, Tune will cause the Transmit indicator to light continuously.

Tone calling Codan 8422 Tone call de/ encoder

Info and operating instructions for radio's fitted with Codan 8422 Tone Calling units.

Thumb wheel numbering. In the centre of the unit is a control for entering the number of the radio you wish to call. All of the ZKG59 group numbers start with a 1 and this number is indicated on the left-hand column of the HF Radio Callsign sheet. Only radios with a number in the left-hand column can be called with the tone-calling unit. Dial in the number of the radio you wish to call.

Call button. To the right of the Thumb wheel numbering is the Call button. When pushed the unit will send out the number displayed and if turned on the called radio will reply with a series of distinctive "beeps". If these are not heard, either the called radio is turned off or the signal may not have gone thru. Try again. If the distinctive beeping is heard, no further calling will usually be needed until the operator of the called radio responds. If after a short period there is no response, try someone else in the group you are calling.

Rule of thumb. If needed in an emergency, call everyone.

Alarm Reset/ Mute button. If your radio has been tone called by another radio, this light, along with the Red Mute light above it will be illuminated. If you are within hearing range when your radio is tone called, you will hear it ring similar to a normal telephone a number of times. Push this button so both lights go out, the Green Unmute light will then illuminate and use the microphone to answer your call.

This button can also be used to mute the radio to eliminate background noise or other people chatting on the radio that you may not wish to listen too. It also allows you to have the radio on at night and not be disturbed unless you are specifically required.

When used for muting purposes, the above Red Mute light only will be illuminated. You will not receive any voice traffic in this state. You will only receive calls directed to your radio by another radio with Tone calling fitted.

When NOT in the mute condition, the Green light will be illuminated.

Your radio has been programmed specifically for your callsign and will only respond to that number.

Good evening. For the antenna to work at it's best it should be clear of obstructions - for example, an antenna mounted below the bonnet would not work terribly well. It also needs a good ground in order to radiate effectively. Despite the concerns raised about mounting auto tunes on the bullbars, there should be little legal angst about mounting a tapped whip on the bullbar, and it is my preferred location to mount them. If you did decide to go ahead with a rear mount, ideally you would have the spring above the roof, however if you are forced to mount it beneath roof level, it should still perform OK (as long as the spring is not to close to the metalwork of the car), but not as well as one mounted above the roofline (not sure if you could tell the difference though).
What you do need to ensure is that a very good ground is achieved between the mounting base and the chassis of the vehicle - if that means using several grounding straps, then so be it.

Sorry I am not to familiar with the radio itself, so cannot assist there - other members here should be able to help a bit more in that area.

Subject: [codan_outback_radio] 7727-TB

I have just bought a very second-hand 7727-TB for our round Australia trip. From reading through old messages on the board, I know that I may recieve comments about a 7727 being good for a boat anchor, etc but other comments from this site indicate that the radio should be a sound choice for what we wish to do.

It has RFDS frequencies fitted: 2020, 4010, 4055, 5110, 5410 and 6890. I have applied for an outpost radio licence for these.
I will be asking our local radio tech to install 8022 and 5455 and will also join VKS-737 to operate under their licence.

I do have a couple of questions:

I found a copy of the service manual at www.ozradio.wireless.org.au/manuals/7727tsm.pdf but probably need an operators/operations manual to fully appreciate how to work it. Does anyone know of a web address where I can obtain one?

Our car is an old Landrover and, given this week's discussion on antenna/aerial location (is it correctly an antenna or an aerial?), we are thinking of putting a mount for the multi-tap antanna/aerial high on the back above one of the oval windows (and only screw in the antanna/aerial when we are stationary and using the radio). How far from the car body should the springy bit (correct name?) and the base be? Could we simply bolt on a big piece of angle aluminium and use

it as a suitable mounting point? Can we put the springy bit and base down below the roofline or must it stick up above the car?

Your advice and serious suggestions are sought.

With thanks,

Koogalau.

The operating instructions for the 7727 series radio which I give people one of these sets are as below. Hope it helps. I can give it to you in a word format if you email me direct
Basic Operating Instructions Codan 7727/ 8727

1) Switch Transceiver On by rotating the Volume control clockwise. The Power indicator will light.

2) Select the required Channel and ensure that you have the correct antenna fitted. Where used this is 7848 Day Channel 1 & 4946 Night Channel 2

3) With the Mute switch Off, set the Volume control for a comfortable listening level.

4) The Mute will remove background noise when no signals are present and may be switched Off to prevent the occasional loss of syllables when communicating in the presence of weak signals.

5) Hold the Microphone side- on, close to the mouth and speak clearly across it. Take care to press the transmit button on the microphone BEFORE speaking. ALWAYS listen before transmitting to ensure that your channel is free of traffic.

6) When transmitting the Transmit indicator will flicker, Tune will cause the Transmit indicator to light continuously.

Tone calling Codan 8422 Tone call de/ encoder

Info and operating instructions for radio's fitted with Codan 8422 Tone Calling units.

Thumb wheel numbering. In the centre of the unit is a control for entering the number of the radio you wish to call. All of the ZKG59 group numbers start with a 1 and this number is indicated on the left-hand column of the HF Radio Callsign sheet. Only radios with a number in the left-hand column can be called with the tone-calling unit. Dial in the number of the radio you wish to call.

Call button. To the right of the Thumb wheel numbering is the Call button. When pushed the unit will send out the number displayed and if turned on the called radio will reply with a series of distinctive "beeps". If these are not heard, either the called radio is turned off or the signal may not have gone thru. Try again. If the distinctive beeping is heard, no further calling will usually be needed until the operator of the called radio responds. If after a short period there is no response, try someone else in the group you are

calling.

Rule of thumb. If needed in an emergency, call everyone.

Alarm Reset/ Mute button. If your radio has been tone called by another radio, this light, along with the Red Mute light above it will be illuminated. If you are within hearing range when your radio is tone called, you will hear it ring similar to a normal telephone a number of times. Push this button so both lights go out, the Green Unmute light will then illuminate and use the microphone to answer your call.

This button can also be used to mute the radio to eliminate background noise or other people chatting on the radio that you may not wish to listen too. It also allows you to have the radio on at night and not be disturbed unless you are specifically required.

When used for muting purposes, the above Red Mute light only will be illuminated. You will not receive any voice traffic in this state. You will only receive calls directed to your radio by another radio with Tone calling fitted.

When NOT in the mute condition, the Green light will be illuminated.

Your radio has been programmed specifically for your callsign and will only respond to that number.

1927. Noise...NGT and an aging Toyota Landcruiser

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-09-22 09:23:34 UTC
From: Mike
Topic: 1927 Message: 1927

With luck some will remember my earlier Posts of about two and a half months ago when I was on my way to Darwin towing a caravan. My NGT was installed in the Cruiser and I continued to suffer from electrical interference for the whole distance Brisbane - Darwin - Brisbane. Numerious attempts and several hundrens of dollars were spent in an effort to identify the source of the noise. I had suppressors on Generators, Oil Gauges, Tacho Gauges and every other sort of gauge. I had earth wires running to chassis from Tail Pipes Gear Boxes, Front Bonnet, Auto Tune wot nots and anything else I could think of. All to no avail. I was NEVER able to use the NGT in a mobile role. I had to stop the vehicle and kill the engine.

It was during that time I rationalised that the Cruiser was 22 years old. It had done 370 odd thousand kilometres, and I was sure I could hear the start of funny noises. Each time I attempted to use the NGT whilst mobile....I rationalised more and more that it was time for a change.

So be it. My wife and I are in our late 60's, and have decided we have done our share of 4WD'ing. It was time to go back to a sedan. We chose a Falcon Futura primarily because it would be able to tow our caravan without undue stress and also because the Futura has some nice features which were absent in the Cruiser.

Where to mount the NGT? The "box" itself fits nicely in the boot under the parcel tray. The control box\microphone sits nicely on the dashboard.

You can see it here:

http://members.iinet.net.au/~mikeltee/DCP_2133sml.jpg

The antenna was a problem. I was aware of the need for a Grounplane, and thought the best place to mount the antenna was in the "middle" of the car. As luck would have it, the Futura came with a Sunroof. I thought it would be fairly easy to mount the base of the Autotune thingy on the centre console between the two front seats. My XYL....which is Ham talk for "Her who Must be Obeyed" sits in the left hand front seat, and I thought she would have been able to hold the antenna thingy and keep it straight. To this end, I cut a hole in the floor carpet to expose the floor pan so that "she" could travel bare foot and so complete the earth circuit.

You can see this attempt here:

http://members.iinet.net.au/~mikeltee/DCP_2127sml.jpg

Well my friends...so much for theory. My idea didn't work. It was a case of either..."my foot is alseep", or "my foot is cold", or "I can't keep it straight", or "it's tingling", or "are we nearly there". A man can take just so much, and I found myself thinking that perhaps the noises and sounds of the old Cruiser were not so bad after all.

I made the appropriate modification. You can see it here:

http://members.iinet.net.au/~mikeltee/DCP_2128sml.jpg

I am pleased to announce that all systems are "go". Reception is marvelous.....I'm a happy man, and...and...and I drive the only snow white falcon on the road with a great big black stick stuck to the back!.....'aint life fun?

On a lighter note. I have no need to install all my other "radio's" in the Falcon. I have already disposed of my Yaeusu FT107M Amateur Tranceiver and the FC102 Antenna Tuning Unit. I still have a Yaesu FT290R 2 Metre Transceiver (Amateur), an aging 27 Meg AM set as well as a 40 Channel UHF Tranceiver. I shall advertise these items elsewhere later in the week, but thought I would make them available here first. No reasonable off refused sort of thing.

ooroo,

Mike.....\\

Ben,

That is the 'call' button. The scan toggle is the button to the right of that showing the handset in the down position. With the newer replacement keypad, they are marked 'call' and 'scan' respectively,

1933. 8528 Tx problems

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-09-23 07:32:58 UTC
From: graeme0428
Topic: 1933 Message: 1933

My 8528 remote head radio does not Tx when ambient temp is hot (>35`c) if I leave it on for say 1/2 an hour or more. It also seems to reduce in Tx power if Txing over a period of more than 15 to 20 minutes on cooler days. When I send a selcal, the Tx light flashes but does not continue to glow. Can anyone give me an idea of the problem ?
Thanks, Graeme.

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-09-23 10:26:56 UTC
From: Tony
Topic: 1933 Message: 1935

Graeme, I had a similar problem with my 9323 & 9350 autotune.
Whenever it got hot it would always give me a "tune fail" & go into
low power output.
I got a bit sus about this & studied some info on Ben's site about
the radio & deduced that my autotune was the culprit. I pulled it
apart & found the coupling between the stepper motor & the tuning
section was worn out. The motor was spinning but there was not enough
grip in the coupling & it was slipping - esp when things warmed up. I
replaced the coupling with a new piece of tight fittig tube & have
never had a problem since. My father in law is up in Darwin at teh
moment & two weeks ago he was experiencing persistent tune fail
problems, after a lengthy phone call & discussion on how to dismantle
the autotune, he too found the drove coupling had failed, replaced it
& all works again. I can not speak for the 8528 & autotune you have
but it might be a consideration - Ben or Jim might be able to shed
some light on this.
Hope it is of some assistance.
Tony - V4757

Malcolm, I do not have the equipment to test that, however I have
tried the 9350 antenna and a dipole, both show the same result. I
was having trouble tonight ie the Tx light was not glowing, so I put
the radio in the freezer for a while. When I took it out I called a
station, and you could read by the Tx light, with the other station
saying that I was clear and strong. I spoke for about an hour, and
towards the end, the Tx light was barely glowing, however the other
station could still hear me OK. All very confusing !!
Regards
Graeme

Graeme,
The finals can be subject to heat failure, could be a capacitor or
tranny on the way out.
I Have had the final caps give problems before.
Mike

With the later versions of the firmware pressing PTT also stops scanning
Perhaps you can get the firmware upgraded

1939. EPROM for 8528 RFDS VKS737 etc

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-09-23 21:00:33 UTC
From: ozeagleqld
Topic: 1939 Message: 1939

Hi I'm new to the group.

I have just purchased and fitted to a troopy a 8528 with 8558 autotune aerial that was originally just fitted out with OTC and 40 channel CB. It doesnt seem to have the standard RFDS channels. In the post archive I saw that someone was compiling frequencies for an EPROM to swap the existing one.
I seek help in where to obtain such an EPROM which channels are available and assistance in how to go about it.
All help appreciated.
Ian

Hi Graeme,
I would suspect you have a problem with the finals myself or something else in the PA stage. If of the finals id RS then the person you are talking to may well still hear you loud and clear even though you are transmitting at a reduced power. Think you need to take it to someone who caput a meter on in the antenna cable to see what is happening.

Ian
welcome to the group
I have eprom images with RFDS etc available for download from my site
http://ozradio.wireless.org.au
You will obviously need an eprom programmer to make use of it. The image
is a bit outdated as it still has the OTC channels in it, and needs
BushTelegraph adding, but it may just do what you need
Cheers
Ben

Ian
any eprom burner that will burn a BINary file to a 27c512 eprom will do.
Others on the group may be able to help with programming, possibly
reprogram your existing eprom.
Cheers
Ben

Hi all,

Can anyone help me out with a schematic for a 6924 (mk1)? and maybe a copy of a manual?
Perhaps the manual is a big ask, perhaps just the pages relating to alignment for a frequency change?
Hoping to start the restoration project soon.

Regards,
Terry

Hi Matt,

Thanks for the quick response. Does that mean that you are able to burn (or get burnt) 8528's but are not doing so at present?

I pulled out my 8528 this morning. From the chip ID the EPROM is a M27C512 150ns. They are available on special from Jaycar Techstore www.jaycar.com.au at $5.00 each. Sounds pretty reasonable to me.

If I can supply the chip is possible to get the 8528 burnt with wide range of channels you are suggesting and at what cost??

Regards
Ian

Hi Ian, no I am unable to burn them myself - I use the local radio shop, as I have gotten to know some of them reasonably well, and they give me a hand when I need it - as I also do in return. Have had my bundle of 8525's now for quite a few months, and I have not got the new eproms done yet, so as you can see I never do things quickly.
I am not certain where you live, so cannot recommend any particular shop for you, however I do know that Jim (lives on the Gold Coast) does do chips for those without easy access to a burner or a friendly local tech. From memory, I think he charges about $50 for a chip programmed and ready to go. Sounds like a lot of money for a $5 chip and a bit of time on the computer and burner, but if you have a play around with the programming software, you will understand that it is a very reasonable cost for the time involved as the software has a variety of little quirks that menas that you can totally stuff up all of your good work if you don't do everything properly. It is absolute bastard software that put simply is not user friendly unless you are using it every day and remember those little quirks.
The software for writing the files to burn was located in the group files last time I looked, so you may want to download it, and have a play with it and you will understand what I mean.

And by the time you've answered the emails, set up the burner, blanked an eprom, programmed an eprom, posted it away and answered the resulting emails.....then there's the ones that come back to bite you on the bum for some unknown reason, in a batch of 4, 3 can be perfect and one crook. (happened quite recently) If you check them by opening up a tranceiver , removing the eprom, putting the new one in, checking, pulling the new one out, putting the old one back in.....it can take quite some time to do the job.
Yes you can do it yourself, getting someone else to do it is a different matter. Maybe I'm slow but by the time I had the correct software, computer etc and knew how to use it I had been trying to burn eproms for over 12 months. The cost of the 512's was previously a bit higher than Jacar btw

Cheers
Jim

Hi Jim,

Thanks for the post. You sound as if you have gone through an exercise. From that do I understand that the 12 months have elapsed, you have mastered the software and are able to burn the EPROMs.

Is that possible to arrange you to do that? I'm in Brisbane.
Regards
Ian

Have had my bundle of 8525's now for quite a few months, and I have not got the new eproms done yet, so as you can see I never do things quickly.
> I am not certain where you live, so cannot recommend any particular shop for you, however I do know that Jim (lives on the Gold Coast) does do chips for those without easy access to a burner or a friendly local tech. From memory, I think he charges about $50

for a chip programmed and ready to go. Sounds like a lot of money
for a $5 chip and a bit of time on the computer and burner, but if
you have a play around with the programming software, you will
understand that it is a very reasonable cost for the time involved as
the software has a variety of little quirks that menas that you can
totally stuff up all of your good work if you don't do everything
properly. It is absolute bastard software that put simply is not
user friendly unless you are using it every day and remember those
little quirks.
> The software for writing the files to burn was located in the
group files last time I looked, so you may want to download it, and
have a play with it and you will understand what I mean.

Hi all,

Burning EPROMS - anybody have some problems? No problem at all.
In my beloved 8528 I had eprom that I do not like, wrote to Codan and they send me new one, burned, it was HAM RADIO option "A". I put it where it belongs and...
I've got Codan 8528 perfect ham rx/tx rig. The fee was 15 US dollars and all was done in very reasonably time. I call that - Codan's "superb aftersale service" - remember I am in Belgrade.
You can "see" my eprom, and rest of the rig, of course, on your screens doing nice job on PSK31 digimode, 14.069.50 Mhz, every morning (for me) from 04.00 - 06.00 GMT.

Wish you all the best folks,

Misa

Don't hold me to this but I think Philip Collins and Associates still actually work on Codans in Sydney without having to return them to McKays or Codan in Adelaide like many stores do.

As for contact details I wouldn't have a clue. I don't even know where they are anymore as I think they moved, but from memory they are in the North Ryde area.

Brian.

From: Malcolm at "On- Track 4WD" in Greymouth
Topic: 1959 Message: 1960

Don't think its in the programming. Like the 8422's there should be either 4 rotary switches inside or 3 plus linking pins. The one closest to the rear on the right is for setting the 1st tone, working towards front 2,3 and 4

You could also try "KARERA Communications" at Hornsby, 02-9477-5999. If number is wrong try this URL:
http://www.karera.com/
Info below from their site. I used to work for them.

Karera was established on the 1st February 1984 as an independent telecommunications company involved in the supply, installation, maintenance and support of telecommunications systems throughout Eastern Australia and the Pacific Islands.

Karera is located at 3 Leonard Street, Hornsby, NSW 2077 a suburb of Sydney with a regional office at 9 Lee Street, Kelso, NSW 2795 a suburb of Bathurst.

Phone: (02) 9477 5999
Fax: (02) 9476 3375

Email: sales@... <mailto:sales@...>
They are agents for CODAN but also do repairs, at least used to.

Sam

Just wondering whether anyone has any info on Codan 7113B Power
supply.

It has 2 'Jones' plugs on the rear and I would like to work out the
pinouts for main power supply and trickle charging a backup battery.

There seems to be lots of pins...for what I'm not sure...

Cheers,

Mark

G'Day Sam, et al,

Spoke to Neil Dekker at Kerera Comms on Thursday. Neil said they have been approached by Codan [some while ago] to service, repair, program etc to Codan radios. They charge $75.00 per hour and Neil says he can get a lot done in an hour so many jobs like putting in extra channels would be at perhaps a half hour rate of approx $40.00.

Neil stated that he has been in HF and commercial radio for greater than 40 years. I found him to be quite knowledgeable. No affiliations etc.

Regards
Terry

G'Day one and all,

I have read and re-read through the NGT handbooks. I have a question to the wiser in the group please.

Re; The placing of phone names and respective phone numbers in the Address book or should these only go in the Phone link section?

I have found they work either way?

2nd Q's how many or what is the limit of addresses and phone links that can be placed into these?

Regards
Terry

Topic: 1973 Message: 1974

Hi Terry

I believe the NGT address book can hold up to 100 entries.

I have a few phone numbers entered in my NGT address book all grouped under "Phone". These numbers were set up as Phone Home, Phone John, Phone Sally, etc. so the NGT groups all these entries relevant to making a phone call under the heading "Phone" which is my understanding of the "Phone Link".

To make a call I select the "Phone" group, tick, and then scroll through the phone entries and select the required entry eg Home.

1977. RE: Fw: [codan_outback_radio] NGT phone link set up?

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-10-06 00:05:21 UTC
From: Peter Cattell
Topic: 1973 Message: 1977

There are 3 'lists' in the NGT - Address, Channel and Phone Link so it is not really correct to say phone addresses entered into the address list and grouped are the same as the Phone Link List.

I use Radtel and in the address list I have 'phone' entries for people that I want to phone (such as 'Phone John'), etc. I also have 'selcall' entries for each of the Radtel base operators.

In the channel list, there are entries for all the channels (frequencies, etc) used by the Radtel bases (called Radtel Ch 13 eg).

In the Phone Link List, there are entries for each of the Radtel bases with the specific selcall to trigger the interconnect to the phone system (called Radtel Charters Towers eg).

If you do not specify a Phone Link and a Channel when you put a phone entry into the address list, you will be prompted when you try to phone someone to choose first a Phone Link entry from the Phone Link List and then a channel from the Channel List.

Hello Ron & Shirley,

Thankyou for your reply.
This is much what I thought. I thought I read somewhere re; the 100 entries but could not find it again so doubt set in! But reading through the darn book, it does become a bit, well lets say ordinary and not straight to the point. I have the names e.g.; home, John, mum etc in the address book and this leads to the phone links so I'll leave well alone.

Regards
Terry

Hi Matt, been there done that and not very successfully :(Go to
email preferences in your Yahoo profile and it should let you do it.
I've tried a few times but it still wont let me post from another
email address, even though it says it will. Let me know if you do any
good. The way my isp is moving I may go to bb also, and a new isp.
Costing a fortune to reconnect etc
Cheers
Jim

Thanks Jim - thought I may have to do that, but thought that there may have been an easier option (yep I am lazy). I decided to change because bigpond has been irritating me with the all to frequent dropouts - For about the same - or less as has been costing me for dialup and monthly costs, I get broadband, and over double the download each month. Should have done it earlier!
Now, where do I find my profile - is there one for all of my yahoo groups, or do I have to do it individually for each group?

Matt

Hi Ian, yes there are some services that provide you with email access over HF. I think that Pentacom are one of them (do a search on google and you should find their website). Connectivity will be very slow - from memory the modems used will be a maximum of 300 baud, possibly as slow as 75 baud (due mainly to the bandwidth of your HF signal you cannot really expect any better than that), so it is a reasonably slow transmissions/reception of the data. I believe that you get an email address with the company, and they then resend the email to you as a text file with all of the crap cut out of it.
Because the connection is so slow, I would be very surprised if anyone offered internet surfing capacity via HF. It is doable via a sat phone, and whilst you can experience a higher connectivity rate on satphone, unless you spend mega dollars on a high speed data setup with INMARSAT, it is still a very slow connectivity rate.

Matt

1995. 8528

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-10-07 22:47:57 UTC
From: ozeagleqld
Topic: 136 Message: 1995

Hi,

On testing with new EPROM unable to pick up any chatter. All the channnels appear on remote head display. When I pick a channel and press TUNE I get a tune fail error message with auto antenna 8558. The antenna makes all the apparently appropriate self adjustment tuning noises. My book for 8528 operators handbook says refer to antenna handbook, which I don't have. Any advice greatfully received.
Regards
Ian

Hi Ian. Did the autotune work with the old eprom ? Seems a bit strange. Even without the aerial tuned you should be able to hear stuff a bit weaker. I'd pop a length of wire in the aerial socket of the radio to determine if its the radio or the aerial. Of course I'm assuming that the mic is plugged in and the selcall mute is turned off of course :))

Cheers
Jim

Hi Jim,

As we say in the computer business, "replace the user and press any key...". Seems I had not put the aerial connector in correctly. Auto tune not responds correctly on "tune" now. I heard a school of the air session but no other chatter, but located in poor urban situation. I will test again this evening away from close buildings. The channels appear to display without error so don't think it has anything to do with the EPROM itself, just "user" issues.
Thanks for the clues.
Regards
Ian

Hi Mike,
When you find the answer let me know. I have just changed my 1992 Isuzu Bighorn with absolutely no noise to a 2000 model with all the noise in creation. Only consolation is that its not as bad as a new Defender 90. Putting the antenna on the rear definitely alleviates the problem a bit. When you find the answer or I have had time to look further maybe one of us will let the other know.???

Greg, the 7113 will output 12v to power stuff, and also a battery float voltage. I suspect thats the one. When the 240 goes off its supposed to automatically switch to the battery to power the gear.

Cheers
Jim (clear as mud eh?)

Hi Greg,

I have a 7113-b in front of me and the upper pins poking out are for an internal circuit that switches the power supply to an external battery in the event of a power supply.
If you use these pins as a power source for a Tx/Rx youll get a slight hum in both modes.
I hope this info is correct. I believe so as I had to modify the output of one of these power
supplys because I had no appropriate connector and I ended up with ripple in the radio.

2015. Re: [codan_outback_radio] info for Codan 7208 Mk 2 antenna tuner

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-10-23 05:04:59 UTC
From: v8master@tpg.com.au
Topic: 2010 Message: 2015

Hi Ian,

I have at present an 8528 Codan hooked into a modified Moonraker 32HF vertical on my roof.
Essentially I have found the best way to use the tuner (and I have fitted a female socket to take a PL 259 plug) is to use it conjunction with an SWR meter as you would normally do and use the SWR meter to get the best readings.

I will point out that sometimes on various frequencies you will get readings indicating no reasonable match or no apparent loading occurring.
You have to continually go back and forth, calibrating and re checking SWR maybe 6 or 8 times to get a good match.

DONT BELIEVE THE METER ON THE FRONT.....IT SPEAKS WITH FORK TONGUE (sometimes) !!

The tuner sometimes seems to have a "sensitive" spot near the number 10 on the "Tune" knob.
A tiny amount of movement makes huge change.

You can get yourself in the ballpark by first adjusting Load, Tune and Antenna and try position C or D on the Antenna switch to get best Rx, which in my case here, seems to get you below 2.5, 3 : 1 SWR straight away.

Of course this will be dependant on the type of antenna you use.

Strangely long wires and inverted L type antennas sometimes will only work with fairly short earth leads (make it as good an earth as possible even if it is short ie. a piece of copper pipe with earth wire clamped on, smacked into the ground a foot or so) with this tuner, but remembering each location, radio, cables etc can have huge effects so there are no real rules of thumb I have found. Suck it and see Im afraid.

I have used this tuner with a number of different radios (Codan, Barrett, Q-Mac, Uniden, Yaesu) and with REALLY makeshift antennas, virtually in the middle of nowhere (and beyond)and it has always let me "get out".

It will tune from 2Mhz right up to nearly 30Mhz even thought the unit is only dedsigned for up to 16Mhz I believe.

Hope that is of some help.....remember this is only one man's opinion though !!

Ben

From: peter
Topic: 2016 Message: 2016

I have an 8528 and wish to add frequency to the eprom.
Do you hook the 8528 up to a computer, if so how or dose the eprom have to be removed from the transceiver and placed into a eprom reader/burner?
Can anyone help with this ?
I brought the 8528/control head 8532/ automatic tuning antenna 8558 in oct 1991 and wish to up date frequency.

Hi Peter. No you do not hook the computer directly to the radio (the 9323 is programmed in this fashion however). A new file needs to be created with the freqs that you want. Then the Eprom needs to be removed from the radio (carefully), wiped, the new file burn't to the Eprom and then the Eprom needs to be placed back into the radio.
A major pain in the arse, and mildly costly unless you have the software and a burner (not to mention heaps of time to work out how to use the software).
From memory Jim charges around $50 to do up a chip - probably the easiest option.

From: Graeme and Lillian
Topic: 2019 Message: 2019

Hello group.
The interface for doing digital modes on the 8528 has
been built and tested and is working fine. The output of the radio can be
adjusted by adjusting the laptop speaker volume output. A power meter is
essential in line for doing this. Also a fan must be fitted to the heatsink
of the radio to assist in heat dissapation so as not to damage the pa stage.
I am in the process of fitting a fan to the radio at the moment. Further to
this I am building another three of the interfaces for people that have
seen the interface working.

Graeme

2028. 9350 Autotune antenna as base sation antenna?

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-10-24 06:21:39 UTC
From: De Martin, Ferdy
Topic: 2028 Message: 2028

Hello,
I would like to test my 9350 antenna, the only solution iI have is to try it on the garden!
Is anyone having experience or advise how to make a ground system or counterpoise which will make working the antenna correctly?

Thank you very much for feedback

Ferdy

Hi from PNG
We used a 9350 on a house in Bougainville PNG where there was insufficient room for a dipole. It works very well from 2MHz to 13MHz frequencies, even for Data connections to the mainland on our email system. Make a bracket for the roof and fix the earth strap to the roofing iron.

To test from a garden make sure you have a good earth stake into wet ground and fix to the earth strap.

We even mounted one onto a 16 foot dinghy with an earth plate over in the water.

Topic: 2028 Message: 2030

I have used my 9350 on a sprinkler stand and a star picket.
The ground I used was simple.
I bolted a piece of heavy palstic covered wire to the braid on the antenna and drove a piece of copper pipe into the ground and clamped the wire to it.
It doesnt hurt to wet the ground thoroughly but how much difference it really makes to gound like this is debatable.
It should work fine, though surprisingly you may need to disconeect the ground on higher frequencies ie. above say 24mhz. I dont know why.

Hi all,

Im looking around for a power supply, 13.8 volt 16 - 20 amps
for use with Codan 8528 base unit.
Maybe 7113 or anything that has the current to run the set.
Open to any offers..... even home brew. Im game !!

I can be contacted on v8master@... or
aqasys@...

Regards
Ben

What about using a 5 to 10 amp supply and a battery. Unlimited current and power when the mains are off. Much cheaper and more friendly.

Hello form Switzerland,

Thanks for all idea, finaly I had success by living the antenna on the grass. Using one iron stick of 30cm. on the ground was enough to get tune on
all coverage
of my Codan! Just amazing.

Best regards to all down under

Ferdy HB9DSP

Subject: Re: [codan_outback_radio] 9350 Autotune antenna as base sation antenna?

I have used my 9350 on a sprinkler stand and a star picket.
The ground I used was simple.
I bolted a piece of heavy palstic covered wire to the braid on the antenna and drove a
piece of copper pipe into the ground and clamped the wire to it.
It doesnt hurt to wet the ground thoroughly but how much difference it really makes to
gound like this is debatable.
It should work fine, though surprisingly you may need to disconeect the ground on higher
frequencies ie. above say 24mhz. I dont know why.

What about using a 5 to 10 amp supply and a battery. Unlimited current and power when the mains are off. Much cheaper and more friendly.

Hi all,

Im looking around for a power supply, 13.8 volt 16 - 20 amps
for use with Codan 8528 base unit.
Maybe 7113 or anything that has the current to run the set.
Open to any offers..... even home brew. Im game !!

I can be contacted on v8master@... or
aqasys@...

Hi Ernie,
Yes it probably does but may not have a very big battery capacity. Also make sure that you do not use a car battery charger. They are unregulated and can cause hum and also charge over 13.8 volts. The optimum is a storage battery, maybe sealed, deep cycle with a regulated 13.8 volt power supply to charge it. A power supply that is capable of running a CB radio will do but may take longer to charge the battery if its only capable of 2 to 5 amps.
If the radio is only used for talking and not any form of continuous running like data transfer its requirements are not great. May draw up to 15 amps but this is only on the peaks of the modulation.

From: Jim
Topic: 2032 Message: 2042

I'll second that advice on car battery chargers. They can cook both the battery (over a period of time) and the radio if not careful. In fact any dc supply without overvoltage protection should be viewed with alarm. The radio lights become vewwwy bright for a short period of time :((
Fortunately there is a solution if you have to use one. Only use it to charge the battery occasionally.

Cheers
Jim

Hello Mal, thanks for your reply. I have Barrett SB250 100w HF set which I took bush recently. I did not have it set up properly and used to set it up temporarily and report in on the daily scheds. I just used the starter box for the power and used a long wire over a tree branch with a manual tuner, worked great. Eventually I am going to setup the Patrol with a Coda 9323 and install the 250 in our Bushtracker off-road van. I am also looking at a Icom IC-400PRO and a 40S handheld. I have a 2010 with programming hardware and software so will have an integrated setup. Will probably sell my Kyodo 208 and 209 and go all Icom. Programming Kyodos is expensive due to Imark only sell the cable gold plated.
Cheers

2045. Power Supply

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-10-28 08:42:51 UTC
From: aqasystem
Topic: 2032 Message: 2045

I am looking for a power supply for use with an 8528 and a 9323 at times.
Something 13.8 volts between 16 and 25 amps would be good.
Will even consider home brew if it's well regulated.
Thanks

Ben
Darwin

2046. I need a power supply :-)

Date: 2003-10-31 11:48:57 UTC
From: rangy92
Topic: 2048 Message: 2048

Hi,
I know of a Moonraker antenna for sale. It looks to be made from metal
that is covered in black plastic. It is two pieces with a loading coil
in the bottom of the top piece. It has 10 MHz on a label on the top piece.

My question, is it of any use? Is it a 10 MHz only unit?
It has a white base that look like it fits a 1/2" base.

Cheers
Wayne

2049. Not so good...mute boards

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-11-01 02:39:33 UTC
From: Jim
Topic: 2049 Message: 2049

After much time wasting and mucking around, my board supplier has been diagnosed with bi-polar disorder and is unable to make up the 6924 boards. As I get my investment back I'm just left with egg on my face and a credibility problem. I was assured that it would be a small project, that we were waiting on parts etc etc. I feel sorry for the guy as its quite a serious medical problem for him. I also feel sorry for those on this list who were looking forward to adding a mute to their 6924's. (I have a box full of 6801 mute boards but they wont fit).
Unless anyone has a replacement supplier at a reasonable cost I'll just have to forget the idea entirely.
Apologies to all concerned.
Cheers
Jim

Topic: 2048 Message: 2050

I have a Codan 8555 autotune which is a moonraker antenna. An autotune 2-12Mhz, It does not sound like the way that you described your antenna. the 8555 can be driven with either the 8551 or option AD board. You can have a look at the moonraker website they still make HF autotune antennas.

The antenna is approx 5' long with the base about 3 " wide that tapers to about 1.5" diameter for about 4' in length. the top section is made of fiberglass. There is one on ebay (not mine) at the moment if you want to see a photo to compare.

rangy92 <wayne@...-users.org> wrote:
Hi,
I know of a Moonraker antenna for sale. It looks to be made from metal
that is covered in black plastic. It is two pieces with a loading coil
in the bottom of the top piece. It has 10 MHz on a label on the top piece.

My question, is it of any use? Is it a 10 MHz only unit?
It has a white base that look like it fits a 1/2" base.

Cheers
Wayne

After much time wasting and mucking around, my board supplier has been diagnosed with bi-polar disorder and is unable to make up the 6924 boards. As I get my investment back I'm just left with egg on my face and a credibility problem. I was assured that it would be a small project, that we were waiting on parts etc etc. I feel sorry for the guy as its quite a serious medical problem for him. I also feel sorry for those on this list who were looking forward to adding a mute to their 6924's. (I have a box full of 6801 mute boards but they wont fit).
Unless anyone has a replacement supplier at a reasonable cost I'll just have to forget the idea entirely.
Apologies to all concerned.
Cheers
Jim

Almost any whip can be "made" to work on other frequencies. Whether you have the resources to successfully mod them is another matter. It can be simple if you're used to doing them, or as hard as buying an antennae analyzer and a load of Sellys steel knead it, some araldite, heatshrink and a lot of patience.

Cheers

Jim..

Try RCS radio in Sydney, they made all the boards for ETI,EA silicon chip DSE etc. They can do one offs as well as re runs of projects etc or if you supply artwork and so on.

They have a website but I cannot remember address. You could try a search engine for RCS radio. They have got a good reputation. No egg.

Regards

Paul

From: rangy92
Topic: 2059 Message: 2059

Hi group,
I have a 6924 Mk2 fitted with a Selcall board.
It sends a selcall when the alarm button is pushed.
It is preset by prom by the looks of it & I guess that it is a 3 digit call.

The question is can I change it to send 4 digit calls?
Can it be changed so that I can select difference stations?
Will it accept incoming selcalls?

I wish to only call vks737 base stations so that I may get through when the bases are on selcall watch only.

Cheers
Wayne

2060. Codan 8011 Selcall Controller

Wayne

2061. 9350

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-11-08 00:15:03 UTC
From: Jim
Topic: 2061 Message: 2061

I have had a couple of folks from this list email and ask if I had any 9350's for sale. Pleased to report that I've been able to source one. It hasn't arrived yet but has been sold to me as being as new. They're not as cheap as the 8558's but of course more reliable and boy are they quick to tune. And if like me you tend to balk at the price, try buying one in NZ !!
Well the mute board saga (ho hum) is still continueing. Been promised a delivery time of 2 weeks but I'm yet to be convinced. I've got about 20 Codan mute boards off an unknown type of set. Longer than the 7727 boards by several cm and have an LM340 reg on one end. They work well on the 6924 but are far too long to fit in :(If anyone has any ideas on what they came out of I'd be happy to hear.
On a humerous note I've been working on a 7515 which has a tendency to be unstable. Son came and asked if I'd fixed the recorder yet ! Must sound like a school recorder. No I hadn't fixed it, lack of schematic.

Cheers
Jim

I assume you are looking for transmit capability in that freq range.
they will rx there by default.
There is no such thing as general TX coverage anywhere on a codan,
especially in that band.
An amateur option is available for the 8528 that will allow free tune of
TX but only within amateur bands.
An eprom profile with 27mhz CB is also available.
http://ozradio.wireless.org.au/8528.htm has details of how these options
work

cheers
Ben

Yep, and in the footage shown from Iraq, I noticed that almost all of the UN vehicles had the 9350 auto tunes on them. Looks like the UN still has it's HF gear running - wonder if anyone has any of their frequencies - could be interesting listening.

From: Matt
Topic: 2067 Message: 2068

I have heard of it being done, but not sure if it was a case of simply wiring it to the radio or if an interface was needed. I suspect that it was direct to the radio as the control board in the 9350 is in the base - whereas with the older 8 series AT, it is in the radio. If no-one here is able to answer, then maybe an email to Codan direct would provide the necessary info.

You're correct as usual Matt. The older 8 series used the AD board (hard to find now) whilest the later 9323 drives the 9350 directly. And of course the old 8525 uses an 8551 to drive the 8558 autotune.
Cheers

I have heard of it being done, but not sure if it was a case of simply wiring it to the radio or if an interface was needed. I suspect that it was direct to the radio as the control board in the 9350 is in the base - whereas with the older 8 series AT, it is in the radio. If no-one here is able to answer, then maybe an email to Codan direct would provide the necessary info.

Has anyone successfully interfaced an Icom 706 HF trasceiver with a
Codan 9350.

If so I would love the details on how you did it.

I think from memory that the most common way of using the 9350 with such gear is to arrange about 10watts and apply some 12v to each of the motor phases in turn until the swr is minimized. The power is then manually cut off. Or something like that, its late and my brain is on strike :))

Hi Jim, yep the brain is certainly not working well at this time of the night. I have this faint memory that is struggling to emerge which seems to think that it is a simple case of connecting up the tuner to the radio and off it goes. There have been a couple of guys who have done it (I think), but I didn't pay to much attention when I read about it (didn't have a 706 then, and still don't have a 9350 now).

Christopher,

I am using my ICOM Mk IIG with a 9350. All you need is a simple short conversion cable to connect between the standard mike type plug on the end of the NGT control cable (or the D style plug on the end of the 9323/8528 plug) and the 'tune' socket at the back of the 706. It uses just 4 of the standard Codan signals/connections (+12v, earth, tune, tune detect).

It does not use the 'scan' signal so unlike the codans, when you scan on the 706 the 9350 does not turn on the broad-band amplifier (which is no problem because as a ham you will probably just be scanning 1 band at a time. My previous antenna was a 'home-brew' screwdriver antenna and I cannot notice any drop in performance but have not done extensive testing. Theoretically, using the sliding inductor in the 9350 should result in more losses than using the sliding fingers of the screwdriver.

As to the cable, I bought mine from Danny at Kyle Communications in Brisbane for $30 mailed to Toowoomba. They are dealers for both Codan and ICOM. Both connectors are sealed so I am not sure if there are small components in either end but for such a cheap price I doubt it,

2075. RE: [codan_outback_radio] NGT phone link set up? save in NGT file at home

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-11-13 04:57:20 UTC
From: Peter Cattell
Topic: 2075 Message: 2075

There are 3 'lists' in the NGT - Address, Channel and Phone Link so it is not really correct to say phone addresses entered into the address list and grouped are the same as the Phone Link List.

I use Radtel and in the address list I have 'phone' entries for people that I want to phone (such as 'Phone John'), etc. I also have 'selcall' entries for each of the Radtel base operators.

In the channel list, there are entries for all the channels (frequencies, etc) used by the Radtel bases (called Radtel Ch 13 eg).

In the Phone Link List, there are entries for each of the Radtel bases with the specific selcall to trigger the interconnect to the phone system (called Radtel Charters Towers eg).

If you do not specify a Phone Link and a Channel when you put a phone entry into the address list, you will be prompted when you try to phone someone to choose first a Phone Link entry from the Phone Link List and then a channel from the Channel List.

Subject: Re: Fw: [codan_outback_radio] NGT phone link set up?

Hi Terry

I believe the NGT address book can hold up to 100 entries.

I have a few phone numbers entered in my NGT address book all grouped under "Phone". These numbers were set up as Phone Home, Phone John,

Phone Sally, etc. so the NGT groups all these entries relevant to making a phone call under the heading "Phone" which is my understanding of the "Phone Link".

To make a call I select the "Phone" group, tick, and then scroll through the phone entries and select the required entry eg Home.

It will be announced soon that limited and novice limited amateur licence holders will be able to use HF Amateur bands from Jan next year, Removing the need to pass morse code exam

As a limited call holder it could be interesting to me finally to use HF Freqs.

Just wounder how many peoples here would try for a novice limited licence to get some HF bands as many here could TX on 80,15,10 mtr ham band.

As a novice limited is very easy to pass, said primary school kids have even passed, will there be a inrush of selcall being transmitted on 80 mters in the evening early next year??

And maybe there will be a few Ham Frequencys programed in codans or Barret rigs.

Just a thought here

Regards

Topic: 2083 Message: 2083

In my never ending quest to become more edumakated I offer the following questions about dinasaurs :))
I note with the 8422 selcall controllers that it has a "scan " facility.
Were the 7727 etc capable of scanning ?
With the same controller, pin 4 appears to be designated as a "quiet line".
What the heck is this ? (Is it the cousin of the old party line ?:)

You'd think that as a fossil myself that I would know all about 7727 stuff.
Strangely enough I know very little.

Cheers
Jim

hahahah Probably highly appropriate :))
The scan facility interests me. The channels were switched manually via a wafer switch.
Just a matter of switching voltage to a particular position, but scanning ?
Yes I suspected that the quiet line was the mute. Stands to reason I guess. Sometimes I
just have problems with the jargon barrier.
Thanks for the help Ben.
Cheers
Jim

10.120MHz is where my NGT normally lives.

I have one channel programmed for each of the amateur bands, and use the Free Tune feature to move around from there.

You can get the Amateur Option password from your Codan dealer, and just need to agree that it is beta firmware and you won't complain if it bites you in the bum :-)

No problems with mine after 3 months or so.

Cheers,

Chris

I understand, the A option needs more than just a password. You have to get the NGT reprogrammed as well if you do not have access to the software. Codan dealers charge $60 - $100 to do this. Beta testing should be finished by late Jan so I am waiting till then to get the reprogramming done on my NGT.

Hi Mike,

we talked this afternoon. No problems with strength. Greg (VK4AML) bought his mount from "Australian 4WD Storage" http://www.aus4wdstor.com/ <chuckwagon@...> for $120.00 plus $15.00 Post a few months ago. You could contact him for a first hand report. There are a few other suppliers too. I think Terlin also make 1. Bye,

Peter

2091. Codan for Packet/APRS

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-11-16 19:53:29 UTC
From: Mike Richter
Topic: 2091 Message: 2091

I'm looking at buying a 9323 or an NGT to use for VKS737 and for Ham voice, Packet and APRS.

I'm aware there is no Amateur option for easy transmitting across amateur bands on the 9323.

Is it easy to get access for injecting Audio after the Mic equalisation circuitry for Packet or APRS for either model.

Or isn't this even necessary for 200Hz shift and I can just use the Mic Input ?

Dino! :),
Pretty sure the quiet line is just a mute. I think our old 7727s did scan, with the help of the
selcall controller.
I stand ready to be knocked down by someone who knows better.

Ok Gents.

7727-C Scanning.

The Scan Facility allows a station to scan up to 6 channels. Two modes of operation are provided:

(a) Mute Control: the voice activated mute halts scanning when it detects a transmission.
(b) Selective Call Control: when used with SelCal controller, the controller halts scanning when a SelCal is received.

BUT.....

7727-C scanning is an option that consists of a Scan Unit, a display PCB and a SelCal control port, all fitted to an otherwise standard Codan 7727-C tranceiver. The little beastie uses a 68705 Microprocessor chip... Factory programmed... The processor monitors all the required inputs and outputs.. Codan magic?

Subject: [codan_outback_radio] New HF Amateur Freqs for Limited Aussie Radio Amateurs.

It will be announced soon that limited and novice limited amateur licence holders will be able to use HF Amateur bands from Jan next year, Removing the need to pass morse code exam

As a limited call holder it could be interesting to me finally to use HF Freqs.

Just wounder how many peoples here would try for a novice limited licence to get some HF bands as many here could TX on 80,15,10 mtr ham band.

As a novice limited is very easy to pass, said primary school kids have even passed, will there be a inrush of selcall being transmitted on 80 mters in the evening early next year??

And maybe there will be a few Ham Frequencys programed in codans or Barret rigs.

Just a thought here

Regards

Hi Alex and thanks for the info. Your input is much appreciated.
What a pity there's no webpage with such data on it re the 77 series.
I'm sure that there are a few of them still around :)
I suppose scanning of chans isnt that complex, all you basically have
to do is switch the voltage across the xtals and ...yes there's a bit
in it LOL
If anyone has the circuit for the 8422 or its interface board (the
little one inside the 77 series) I'd love to receive a copy.
Absolutely amazing what collective resources this group has.

Cheers

Yep, agreed... but There is obviously some time involved for the dealer to obtain the password for
you and time=$$ as they say. $100 for an amateur transceiver is cheap if you ask me.

2096. Bushcom antennas

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-11-17 08:58:46 UTC
From: Matt
Topic: 2096 Message: 2096

A friend on mine has a bushcom antenna up and running for HF. Looking at the specs it offers great coverage across the HF bands, and I think I want one. There is a slight problem though - on his property, he has heaps of room to put up a 48m long antenna, living in Town I unfortunately do not. I could probably run it as an inverted V, but I fear that with my small block, the legs would be to close together. Does Bushcom make smaller variants that will still do 80m and up? If so, is there a website or other contact details that people may have tucked away. Looks like I will be on HF amateur as of 01 Jan, and I think that this style antenna may be my primary HF antenna.

2099. Best Frequency - Hourly prediction

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-11-17 09:20:41 UTC
From: Mike Richter
Topic: 2099 Message: 2099

What is the best frequency to use from A to B ? There are the usual guidelines but as we've seen recently the Ionosphere is very variable !

The Ionospheric Prediction Service now has a website with hourly updates on the best frequency to use from major locations within Australia. This is based on ACTUAL propagation MEASUREMENTS in the last hour, not predictions made days or weeks ago as we are used to.

http://www.ips.gov.au/Main.php?CatID=6&SecID=1&SecName=Australasia&SubSecID=1&SubSecName=HAP%20Charts&LinkName=Hourly%20HAP%20Charts

Go to this link (you may have to remove the line breaks), select your present location and it shows a map with coloured bands centered around your location on a map of Australia. Use the nearest frequency for the colour over the B end on the map.

If you can't get the link above to work go to
http://www.ips.gov.au/Main.php?CatID=6
and click on Australasia / HAP Charts

Mike VK2BMM/Romeo14

Matt, I also run one of these beasties. Can't complain about their performance, for a broadband aerial they work well. Their construction is also excellent, however they havent yet solved the problem of attaching it to trees in winds, like all wire aerials they have a tendency to operate horizonatally polarized after a storm :((

Cheers

Thanks Charles. I'm actually well aware of this method but it's a little impractical in my particular case. Over here my trees are full of rather nasty large ants. Any climbing is an interesting experience ! The counterweight pully can of course be thrown over and pulled up, but that enatils another breakable component. Plus I'd need to transport a bucket of cement up a slope :)) Whilst this method has proved to be quite useable in the past, in this particular case I'm thinking a bloody big spring might not be a bad thing .
Cheers

Subject: Re: [codan_outback_radio] Bushcom antennas

Matt, I also run one of these beasties. Can't complain about their performance, for a broadband aerial they work well. Their construction is also excellent, however they havent yet solved the problem of attaching it to trees in winds, like all wire aerials they have a tendency to operate horizonatally polarized after a storm :((

Cheers
Jim (with his u beaut aerial still on the ground)

Subject: [codan_outback_radio] Bushcom antennas

A friend on mine has a bushcom antenna up and running for HF. Looking at the specs it offers great coverage across the HF bands, and I think I want one. There is a slight problem though - on his property, he has heaps of room to put up a 48m long antenna, living in Town I unfortunately do not. I could probably run it as an inverted V, but I fear that with my small block, the legs would be to close together. Does Bushcom make smaller variants that will still do 80m and up? If so, is there a website or other contact details that people may have tucked away. Looks like I will be on HF amateur as of 01 Jan, and I think that this style antenna may be my primary HF antenna.

Matt

To: codan_outback_radio@yahoogroups.com
Subject: Re: [codan_outback_radio] Bushcom antennas

Thanks Charles. I'm actually well aware of this method but it's a little impractical in my particular case. Over here my trees are full of rather nasty large ants. Any climbing is an interesting experience ! The counterweight pully can of course be thrown over and pulled up, but that enatils another breakable component. Plus I'd need to transport a bucket of cement up a slope :)) Whilst this method has proved to be quite useable in the past, in this particular case I'm thinking a bloody big spring might not be a bad thing .
Cheers
Jim

Jim,

Try this pulley and counterweight method, thanks to N6ECV:

http://www.n6ecv.net/antenna.html

This allows the trees to sway in the wind without breaking a wire
antenna.

73,

Charles

I have fitted a 80m/40m trapped inverted V dipole on a suburban block. The
trap reduces the overall length. Only problem is making or buying the traps!

Hi Peter, the traps are no worries if you make them and adjust with an antennae analyzer. The beauty of these devices is that they are portable. Hence the traps can be adjusted in situ. In the old days we used a GDO to get them approximate and then ran to the tx and back to adjust. So much for the "good old days" :))
Cheers
Jim

Yep, thought of that, and I am not terribly keen on traps, but they may be the only option available to me. I think that a Bushcom set up as an inverted V may be the best option.

Thanks Jim - actually found one of your postings using the google search, and you seemed pretty happy with it. The bushcom that my mate has up hasn't fallen down in winds yet (in about 8 years that he has had it), so I do like their sturdiness, and I reckon they certainly do look like serious antennas with all the effort that has gone into the construction of them.
I cannot get any useable information from the bushcom website due to the java script they are running - even when I perform the security changes that they tell you to do, it still doesn't allow me to open it up. Anyone able to cut and paste the basics (i.e. models, coverage, and costs?)

Matt, I also run one of these beasties. Can't complain about their performance, for a broadband aerial they work well. Their construction is also excellent, however they havent yet solved the problem of attaching it to trees in winds, like all wire aerials they have a tendency to operate horizonatally polarized after a storm :((

Cheers

Howdy

I also believe there is an option for LSB and AM and extended range for the 8525/8 to facilitate up to 10m and the different sidebands.. Is this the case..

Has anyone had it done.. If so what is the rought cost.??

The 28 will do all the HF bands. Above 24meg the low power loom needs to be fitted. However the "A" option didnt include WARC bands. Drop me an offline email for further details.

I also believe there is an option for LSB and AM and extended range for the 8525/8 to facilitate up to 10m and the different sidebands.. Is this the case..

Has anyone had it done.. If so what is the rought cost.??

I have just been out to the cruiser and checked. In addition to 80/40/20, I also have free tune TX on 10 MHz, 18 MHz, 21 MHz, and 28 MHz. On 18 MHz I have free tune TX on 18 MHz from 18 - 18.2 MHz which covers more than the 18 MHz WARC bands I thought (cannot remember the exact coverage, but I think this is greater than the specified band plan).
Anyway, I am off to bed as I am up early in the morning. Cheers all, and thanks for an informative chat this evening.

Matt

The 28 will do all the HF bands. Above 24meg the low power loom needs to be fitted. However the "A" option didnt include WARC bands. Drop me an offline email for further details.
Cheers

I have the 8528 - it has the LSB crystal in it, as well as the amateur option enabled. It defintely does 80, 40, and 20, but not certain what other bands.

Hello Jim,
Just wondering is there any solution for the 9480 to make it work up to
28MHZ?

Thanks for feedback

Ferdy

Thanks very much Jim - just what the Doctor ordered. All I can say is OUCH to the prices they want. When my mate bought his it was only $250 - and they now want $375 for it. Looks like I might have to bite the bullet and get something like it though. I reckon I would have the centre up at about 12m in the air (nice big tree out on the front nature strip), and the ending up at about 7 metres for the ends, and about 15-20 metres apart. Not perfect I know, and a very narrow angle for an inverted V, but about the only option that I would have for an antenna of that length.

Subject: Re: [codan_outback_radio] Bushcom antennas

Thanks Jim - actually found one of your postings using the google search, and you seemed pretty happy with it. The bushcom that my mate has up hasn't fallen down in winds yet (in about 8 years that he has had it), so I do like their sturdiness, and I reckon they certainly do look like serious antennas with all the effort that has gone into the construction of them.
I cannot get any useable information from the bushcom website due to the java script they are running - even when I perform the security changes that they tell you to do, it still doesn't allow me to open it up. Anyone able to cut and paste the basics (i.e. models, coverage, and costs?)

Interesting point mike, its very common for Amateur APRS Packet there is a national freq on 2mts alocated and many active users playing around with it i know of at least 3 in melbourme playing with embedded GPS boards and microcontrollers.

I think its possible on a 8525/8528 to use the selcall FSK coder and decoder as its already a 100 baud modem only need to install a microcontroller and a GPS NEMA input for the radio to provied a postion service.

I had a pet idea of a HF small message service using a small LCD display module, kepad and micro to send messages upto 120 charters via a HF simplex link.

Infact its somthing im sure VKS737 would like to offer to its members but to date not able to do, but as amateurs its something we can play with, any ideas here guys

Regards

Well our old 7727-t's apparently scanned as well, when you had selcall activated, but we had a lot fitted with a selcall mic unit, Jim you know the one I've talked about.
From what I can tell it was a similar operation to the scan fitted to late model "WAGNER" 1729 and C1-100 models used by other government departments. Going back 25 odd years of memory here!
Wagner used a simple (Complicated Technical wizardry at the time!) counter chip like the one used in the "Knightrider Scanner" ETI kit. It simply pulled the1 to 8 channel lines low sequentually when in scan mode (DPDT switch disconnected normal channel selector.). The unit listened for 2 or 3 seconds on each channel before going to the next one, unless a valid call tone (Two-Tone only, this was before CODAN HESH and MESH Selcalls.) was recieved, then the tone receiver would unmute and sequencing would stop. Channel rx'd would either be diplayed as an illuminated LED in a bargraph or like some of the ones I've used and worked on, the frequency would be diplayed on a led digital readout that was diode strapped for the channel.
That's enough Dinosaur thoughts for the moment.
By the way Jim and Ben, we have moved house (Bit the bullet.) to 1 and 3/4 acres out of town so plenty of room for the HF antenna now plus room for overnighting travellers as well :-), I'll be sending COA emails out shortly . Mind you the Troopie lasted the move then cracked a piston so until I fix it the only transport is my wifes Daewoo Matiz (800cc 3 cylinder hatchback.) and shoehorning the 8528 into it isn't an option.
Now maybe that 6924 will fit, Hmmm, I'll get back to you on that.

Sam.

Hi Sam, glad to see you almost back on board :) Yes those dino saurs seem to have a habit of coming back and biting me on the bum. Trying to marry an 8422 selcall unit to a 6924 at the moment.....fun.
The larger blocks of dirt are great until it rains, the grass grows, the sun shines and you have to buy a sit on mower and a decent sized jungle cutter to do all the snakey slopes etc every weekend. I do mine in very small bits so when I've "finished" I have to start again. Mind you its easier to sit and listen to the birds enjoying the bushes/trees that are nearly cutting the 240v mains cable.
And the ants love the trees so climbing 50ft up isnt an option. You quickly find that the lowest branch works almost as well for aerials.
Sorry to hear of the Troopy. I thought they went forever, what did you do forget the oil ? :))

Cheers
Jim

No stress Jim, sorry guy's.
At the moment rain isn't a problem, we are as dry as where Perry is, also we don't have any hills just a seasonal creek at the back cutting through the Macadamia plantation which is as dry as the Al-Wasid wadi at the moment.
I'll get my ubeaut 30m 1.6 to 30 mhz end fed-resistor shunted semi delta long-wire (As designed by Mark Robinson from Philip Collins and Assoc. in Sydney for use in the islands and New Guinea. And yes it sounds a strange beast but it does work!) up shortly, the green tree ants don't like the 60 foot Kapok tree I'm eyeing off for a center support but I may have to run the earth return by wire as the ground isn't trrribly conductive at the moment. :-(

Sam, have the solution for the low ground conductivity. It involves a party where lots of grog is consumed if you get my drift :)))

Cheers
Jim

No stress Jim, sorry guy's.
At the moment rain isn't a problem, we are as dry as where Perry is, also we don't have any hills just a seasonal creek at the back cutting through the Macadamia plantation which is as dry as the Al-Wasid wadi at the moment.
I'll get my ubeaut 30m 1.6 to 30 mhz end fed-resistor shunted semi delta long-wire (As designed by Mark Robinson from Philip Collins and Assoc. in Sydney for use in the islands and New Guinea. And yes it sounds a strange beast but it does work!) up shortly, the green tree ants don't like the 60 foot Kapok tree I'm eyeing off for a center support but I may have to run the earth return by wire as the ground isn't trrribly conductive at the moment. :-(

Subject: Re: [codan_outback_radio] Bushcom antennas

Matt, have seen them in all sorts of configurations. They dont seem to mind
too much. I suspect that broadband aerials are easier in that respect.
Got mine secondhand a few years ago.. Seen a couple for sale around the
traps recently. Bushcomm may even have a s/h one, you never know your luck.
I guess the other option is to try and buy their bits and build one or as
you say just bite the bullet. If you do I'm sure that it will perform well
and last for a long time. Thats what I need in an aerial.
Cheers

Thanks very much Jim - just what the Doctor ordered. All I can say is
OUCH to the prices they want. When my mate bought his it was only $250 -
and they now want $375 for it. Looks like I might have to bite the bullet
and get something like it though. I reckon I would have the centre up at
about 12m in the air (nice big tree out on the front nature strip), and the
ending up at about 7 metres for the ends, and about 15-20 metres apart. Not
perfect I know, and a very narrow angle for an inverted V, but about the
only option that I would have for an antenna of that length.

Thanks Jim - actually found one of your postings using the google search, and you seemed pretty happy with it. The bushcom that my mate has up hasn't fallen down in winds yet (in about 8 years that he has had it), so I do like their sturdiness, and I reckon they certainly do look like serious antennas with all the effort that has gone into the construction of them. I cannot get any useable information from the bushcom website due to the java script they are running - even when I perform the security changes that they tell you to do, it still doesn't allow me to open it up. Anyone able to cut and paste the basics (i.e. models, coverage, and costs?)

2127. Re: Bushcom antennas

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-11-17 23:12:08 UTC
From: Mark
Topic: 2096 Message: 2127

Just read some of the postings about broadband antennas.

Have a look at this mob...Broadband Propagation.

http://home.dialix.com/~u3566/BEST_1b.html

They make similar antennas to Bushcomm but significantly cheaper. I purchased the 'CFB' - Centre Fed Broadband dipole....$275 incl GST I think. Have unpacked it and the construction appears to be excellent, with high quality conponents and stainless steel wire etc. etc...

As for operation....you'll have to wait until I have the time to put the thing up...after the silly season I guess. suburban blocks aren't the easiest for these beasts, but I figure the inverted V configuration or something similar will work OK, just need to get the centre of the antenna up high enough.

Cheers,

Mark

Hmm, certainly seem similar. And if they are cheaper, well I'd guess it boils down to preferences. Are they based in Oz? And what is the 36kw array in Mt Gambier used for ?
Cheers

Hello,
Another solution is homemade antenna like the T2FD! which is by the way an
excellent antenna for DX listining specialy over tropical band (2.5/6MHz).
Work well on inverted Vee
here some link:

Thanks Ferdy and Mark - I am leaning towards the broadband propagation antennas now - I think that I like the look of the BPA30, and the CFB120 - will have to decide and see what best suits my needs.

Hello,
Another solution is homemade antenna like the T2FD! which is by the way an excellent antenna for DX listining specialy over tropical band (2.5/6MHz).
Work well on inverted Vee

Just read some of the postings about broadband antennas.

Have a look at this mob...Broadband Propagation.

http://home.dialix.com/~u3566/BEST_1b.html
<http://home.dialix.com/~u3566/BEST_1b.html>

They make similar antennas to Bushcomm but significantly cheaper. I purchased the 'CFB' - Centre Fed Broadband dipole....$275 incl GST I think. Have unpacked it and the construction appears to be excellent, with high quality conponents and stainless steel wire etc. etc...

As for operation....you'll have to wait until I have the time to put the thing up...after the silly season I guess. suburban blocks

aren't the easiest for these beasts, but I figure the inverted V configuration or something similar will work OK, just need to get the centre of the antenna up high enough.

Cheers,

Mark

> Thanks very much Jim - just what the Doctor ordered. All I can say is OUCH to the prices they want. When my mate bought his it was only $250 - and they now want $375 for it. Looks like I might have to bite the bullet and get something like it though. I reckon I would have the centre up at about 12m in the air (nice big tree out on the front nature strip), and the ending up at about 7 metres for the ends, and about 15-20 metres apart. Not perfect I know, and a very narrow angle for an inverted V, but about the only option that I would have for an antenna of that length.

The bushcom that my mate has up hasn't fallen down in winds yet (in about 8 years that he has had it), so I do like their sturdiness, and I reckon they certainly do look like serious antennas with all the effort that has gone into the construction of them.
> I cannot get any useable information from the bushcom website

due to the java script they are running - even when I perform the security changes that they tell you to do, it still doesn't allow me to open it up. Anyone able to cut and paste the basics (i.e. models, coverage, and costs?)

Matt, if life has you in the "povo" basket (like most of us :), take a peek in this groups files section. I posted a quick selection of homebrew aerial designs there some time ago. There's even a copy of a wideband one made from easily availiable material.
Cheers
Jim

2134. Codan 402 ??

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-11-20 08:12:25 UTC
From: tunzafartz
Topic: 2134 Message: 2134

I have an antenna here which is reputedly a Codan 402. It is a multi-strand sloping travelling wave type, similar to the BushComm BBA-100 types.

Does anyone have a pic of one that I can compare with, so I can positively ID it? This is going to be offered on ebay shortly (unless someone here wants to make me an offer beforehand) and I want to make sure the description is as accurate as I can.

Thanks

Peter

2135. Re: Codan 402 ??

From: vk5sa
Topic: 2134 Message: 2135

Peter,

The 402 was half a travelling-wave dipole, and covered either 2 to 10MHz or 2.5 to 16MHz.

They were *very* earth-dependant, and have not been made for 10+ years, to my knowledge.

Try RFS (03 9751 8400) or Lencom antennas (08 8365 1900) if you want an efficient end-fed broadband.

Yes, we used to use them in the odd tight situation in the late
eighties, but soon found better solutions.

I don't need one, as stated I plan to offer this one on ebay as soon
as I can confirm its identity.

I actually have an intense dislike of any asymmetric HF base antenna.

Thanks anyway.

Peter

2137. Codan 8528 & 9350 antena

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-11-21 11:14:09 UTC
From: Bill
Topic: 2137 Message: 2137

I would like some information please on the suitability of the Codan 8528 radio and 9350 atu antena for marine use.
I am with a volunteer marine rescue unit and the subject set up was "aquired" to use on their new 9.3 meter alloy rescue vessel. The set came off of a 4X4 and is in a servicable condition.
The local marine electronics seller has informed the volunteers that the unit can not be used in a vessel, or for marine frequencies unless a different ATU is purchased and the radio is "modified". His quote to the volunteer rescue unit is "about $1000, could be more".
As I have no knowledge of the HF radio system I am hoping that you can help. I can not see why the radio would not work on a boat as well as it worked on a 4X4. Would it not just be a case of tuning it to the marine frequencies? A life on the water would physically be no harder than being shaken about over 1000s of kilometers of corrigated dusty outback roads.
I am concerned that these volunteers are being given the wrong information by someone that is possibly after a sale - having missed out on selling a new unit - when it may not be needed. Any help to these volunteers would be appreciated. If you are interested the volunteers have a webb site, and the vessel in question has the call sign "SA24". Webb address is "www.smra.com.au"
Thanks
Michael

2138. Re: [codan_outback_radio] Codan 8528 & 9350 antena

Yahoo group: codan_outback_radio (1997 — 2004)

From: Matt
Topic: 2137 Message: 2138

Hi Michael - replied to your post on the work system, but anyway, here goes - probably a more accurate reply now that I have had time to htink things over.
Basically it is my opinion that it is not a good idea to use the 9350 auton tune in a marine environment. Physically it may be similar (although I do have doubts as to it being able to survive for long periods of time), however the tuner is not built to survive the corrosion that you would experience in a marine environment.
The radio and tuner ARE able to work on marine frequencies without any problems at all. The radio would require a new Eprom with the marine freqs programmed into it.
Modifications, well maybe AM mode for 2182KHz, but really not necessary. Possibly a tuner control card for another ATU - not certain on that, but if one is needed, then it is a case of removing the cover, plugging in the card and screwing it down.
Pricewise - could easily cost more than a grand if you go for a codan ATU and the antenna to go with it (much larger than the whip on top of your current tuner). A cheaper option would be something like a smart tuner or similar - still not cheap (not certain on the prices, look them up on the net), but certainly a lot cheaper than the codan variant (you will still need an antenna for it though) - many of the fishing boats up in FNQ have gone this way.
Depending on what he wants to do to the radio, and what sort of tuner / antenna combination that he is recommending, depends on whether he is ripping your mob off or not.

Cheers

Matt

Topic: 2137 Message: 2139

Michael. I would be reticent to use an atu in the marine evioroment. I'm sure it would pack it in pretty quick with corrosion problems. Maybe a long wire antenna with a manual tuner may be more suitable , certainly a lot more reliable. Dedicated marine sets have 2182 AM emergency channel fitted so whether the lack of this would preclude getting a marine licence is a consideration. I have a very good Barrett SB250 Marine set for sale and may be looking for a 9350 atu so we may be able to do an exchange deal.

Date: 2003-11-22 02:29:33 UTC
From: Jim
Topic: 2137 Message: 2141

Hi Michael. The answers are a little more complex than "can we use it". Obviously you can. The 8528 can even be modded for am operation on 2182 as far as I know. However what about parts availability ? In the unlikely event that your set becomes inoperable, Codan no longer carry many parts for these units and your set may be out of action for many months while you search for a replacement part.
The 9350 is an excellent atu but as some have suggested may not last too long after the salt gets to it. (I would be delighted to hear that I am wrong) The later atu's that feed a whip or bit of wire can be stowed in an easier environment and I suspect that this would prolong the life of the aerial system.
So the end result is what was your radio bloke suggesting ? Modding the set? Eproms can be programmed with whatever marine frequencies you require at a small charge. The am option may need a bit of work but nothing approaching 1K. Supplying another type of atu wont be cheap but sale of the 9350 would probably cover or at least offset the cost.
I guess that like most things in life there are decisions to be made but at least now you have the information to make those decisions. Good luck with your choices.
Cheers
Jim

Hi everybody,
Now have tha fan fitted to the 8528 heat sinks and
am starting to do Slow Scan Television mobile. Progation the last couple of
days has not been good but I have been doing Slow Scan into Europe and North
America from the radio shack. Been using the home brew interface and seems
to be working ok.

From: Jim
Topic: 2143 Message: 2143

Well, the saga of supply has finally finished. In my hot little hands are $350 worth of mute boards for the 6924 mk1s. (can be put in mk 2's also) I'm once again offering members of the list complete boards at $35 + post each. Thats what they cost me. Any surplus will be put on ebay (at a more realistic price) to see what external interest there is.
Those who are still interested or requiring further details please hit me offline.
Cheers
Jim
PS I also have mute boards for the 6801, 7515 and 7727's. Despite my verbosity I'm feeling a bit ...errr...mute ?

Michael
as Jim suggested $1000 is very pricey for what needs to be done.
You can convert a Land based 8528 to a marine based 8528S by doing the following
1) Change the eprom. This will enable the marine distress calling and AM on 2182khz
2) Remove one resistor to enable AM to work
3) Change the front panel. You might be able to buy the stick on switch membrane from CODAN, check with them, OR simply relabel the panel - only 3 or 4 buttons are different OR get a marine control head.

All up no more than 1 hours labor, including a full check of functions.
Preparing the eprom may take longer but there are those who lurk here that can help, Jim & myself included.
I would check to see if Aust marine authorities still monitor HF. I did hear a whisper a while back that the services were winding up. Being part of a marine rescue organisation you would know better than me.

As far as the antenna goes a 9350 would most likely rust itself to pieces even though they are well sealed. Contact an antenna manufacturer such as RFIndustries who can custom make antennas or supply off the shelf items. I'd take a punt and say they would have a marine HF antenna to suit.
cheers
Ben

Topic: 2146 Message: 2146

Just found this info on www.mods.dk

04-02-2003 Codan Auto tune mod

Author: Paul R Ashby - comtech2@...
have just finished adapting the Famous Codan 9350 autotune antenna to
a Kenwood TS-50S. This is a fantastic resonant antenna from 2-30 Mhz,
and has only been available to 4WD'ers in the past.
RegardsPaul R Ashby

I've saved the PDf to the FILES sectio of this group since it hard to
find on www.mods.dk

In the last week on eBAY two 8528's with 9350/8558 have been passed in because no-one wanted to pay the reserve price of $1500. Maybe it's because the parts are getting harder to get.

Personally $1500 is reasonable for an 8528 with a 9350 if its all operational. Cant say Id pay anywhere near that for an 8528/8558 combo.

Seems that the $1500 mark has been around for a few years. You can buy 9323s/9350s for around that money BUT perhaps the amateur option on the 8528 keeps them attractive.

From my experience servicing 8528's they are still reliable and yes some parts are NLA but the majority are off the shelf stuff.
in order of component failures from common to rare Ive found.

1) transistors on OPTION AD board. nearly standard replacement now. You only need this board with the older 8558 antenna
2) one of the internal fuse links blow causing either no TX power or total failure of the set. easy fix
3) seen about 3 PA transistor failures in the last 6 years. From memory the transistors are pricey but still available
4) one 10v reg failure.
5) one or two lithium battery failures, I suspect this will become more common with age. Pretty easy to diagnose because you keep losing the scan table
6) the odd VCO failure. trickiest of them all but still relatively uncommon

Unless you can get it cheap Id avoid the 8558 antenna. True there are still lots in service and will continue if properly maintained but some early ones had the internal tubes made from clear plastic which shatters pretty easily. If this happens you have a nice wheel chock.
Look for ones with a serial beginning in C or D. Some early C models still had the clear tube but not many.

The 8525B shared all its circuitry with the 8528 up until nearly the end when the micro board was changed so maybe a few 'scrap' sets may turn up soon.....

Mr Codan may disagree somewhat and want to sell you a new set. The NGT is a fantastic radio even more so now with the amateur option, but if they didnt make such good stuff in the first place the old '28 wouldnt still be around would it???????

cheers
Ben

2153. New member intro

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-11-23 10:49:51 UTC
From: Bob Sayers
Topic: 2153 Message: 2153

Hi, All,

I've recently joined the group because I've always been fascinated by the use of HF in outback comms in Australia, but also particularly because I'm currently involved in a research project to evaluate the role of HF in providing a backbone emergency comms system in the UK. The Codan NGT is currently looking to be the radio of choice for this application because ALE and the simple user interface will be huge benefits where potential operators will be emergency managers foremost, and with HF operating skills and experience a long way down their CVs!

I'd be very pleased to hear from any of you who are involved in emergency management networks of this sort.

A quick final question - I envisage that at the moment our radios will be used primarily as base stations, but a mobile or transportable ability will be an extra benefit. Consequently, I'm thinking of using the "mobile" version of the NGT, but with the transceiver box and mains PSU mounted in a ruggedised box such as those made by Peli in the US. The only real problem that I see with this is ensuring that users are aware of the need to leave the box lid open to retain ventilation when in use. Are any of the rest of you using any similar arrangement?

best regards,

Bob

Hi Bob, as I've said previously, a fascinating project.
The portable/mobile option. I assume not mobile as in car? Great idea to put them in boxes (for a different take see http://www.jimshire.aussiewide.com/). The earlier Codans work very well indeed in boxes.
Pardon my ignorance but won't the NGT handset have to be out of the box so that they can be used ?(ie the box must remain open). If not there's a simple solution. 2 leads from the speaker shorted when box is closed combined with LED in box top connected to radio saying when light is on box must be open.
Hows that for fuzzy logic ?
Cheers
Jim

Interesting HF comms is still in the plans of Distplan comms, in UK
of all places you would think with such a small place can use low
band VHF for a comms backbone, but i guess HF still got the advantage
of 100-300km range over ground wave any time or season between a base
and mobile, with 90% reliablity

For base control maybe use a remote interface with pair interface so
as to have the TX/Antenna unit away from where the operators are, im
sure the NGT dose support remote operation, as you got the advantage
of seperating the HF antenna from general office equipment, that will
help in RFI problems.

2166. Playing radios

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-11-24 12:23:07 UTC
From: Jim
Topic: 2166 Message: 2166

As well as playing mute circuit boards I've also been playing 8422 selcalls with them. (pity they don't fit inside the radio :) Not as versatile as a fully blown 8525 A even but a lot cheaper. When the rats nest is finally sorted out I'd like to take some pix and put them in the groups files.
One thing I was lucky enough to buy was a manual for the 8422's that states categorically that my 8422's (series A1) do not decode anything. This proved not to be the case (and many thanks to Malcolm from On Track 4wd on this list) for his expertise. (and patience). Hearing those phone rings in the 6924 was a bit like the first time I used selcall in the bush, quite startling.
I can recommend playing with the old dinosaurs. A heck of a lot of fun, and if you do stuff them its a lot cheaper than fixing a 9323/NGT :)
Even dinos have their uses.....:-)

Cheers
Jim

Peter,

Follow the link below.....

http://cgi.ebay.com.au/ws/eBayISAPI.dll?
ViewItem&item=3057270271&category=3308

or if no luck, do a search for 'codan' and click the 'completed
items link.

There is no photo, just text.

Hope this helps.

Cheers,

Mark

Mike,
I have mine (Codan) mounted on the rear tyre mount Prado, I
reckon there much the same, unfortunately mine was done in Melbourne
but I will try to find the name of the supplier & get back to you.

2172. 9323 Mic Technical info

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-11-29 21:52:38 UTC
From: Mike Richter
Topic: 2172 Message: 2172

If you are trying to track down problems with the 9323 Microphone Keypad, it helps if you know how it works. I have saved to the FIles Section of this Group the Datasheet for the Kypad Encoder - 9323 Mic Encoder m3004lab1.pdf.

The IC is intended for Infrared remote controls up to 64 keys.

Mike VK2BMM Romeo14

2177. RFDS..radio or satphone

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-12-02 03:04:32 UTC
From: Jim
Topic: 2177 Message: 2177

I recently had occasion to find out that each RFDS division appears to have complete control over their own operational policy. In theory this means that QLD could decide that they are only using satellite phones and not radio.
As far fetched as this appears I was informed some time ago that the QLD division is trying to "wind back it's radio operations".
I am so far unable to confirm that this is current or future policy. One would hope not !
I would of thought that their potential client base was increasing rather than decreasing.
We've all been weaned on the idea that they're only a call away. But what sort of call ?
I wonder if any member of this group has any info to offer ?
Cheers
Jim

Yep. Mine cost me $300 less than that 12 months ago. I'd love to find out which scrap dealer will get the QLD police's "old" 9323's as they roll out their NGT's :-)

Cheers
Jim

I have finally (after a few phone calls etc) clarified this matter with QLD division.
Whilst the useage of their services on HF have decreased, they have no intention at this point of time of throwing HF in the dustbin.
It appears that most of their traffic from travellers now comes by phone. I wonder if this is because of the networks (737, Bush Tele) ? The figures on outpost licenses would also be interesting.
The manager could not identify the person who had made the initial statement to me and suggested that it might of been a misunderstanding. Yeah, right. Some things I get wrong but not that.
Anyway thats the good news.
The "bad" news is that my aerial is down again and its been too hot and muggy to get out in the sun. Still works on the ground but of course not quite as well :-) Hate to put the Z meter on it....yikes.
Cheers
Jim

Subject: RFDS Emergency Alarm Monitoring

Mr Balm

The RFDS Emergency Radio Frequency monitoring service is alive and well. We continue to monitor the alarm frequencies 24 hours per day, 365 days/year.
At this stage and into the foreseeable future the RFDS has no plans to stop monitoring these frequencies.

I would add that the RFDS does not use SELCALL on its HF radio frequencies.
This allows for all HF radios fitted with RFDS frequencies to access our network. There are a considerable number of older model radios still in use that do not have SELCALL facilities but still may need to contact the RFDS in an emergency. For this very reason the RFDS has not changed to SELCALL monitoring but uses a more"open" monitoring format.

I hope this answers your question. If you have any more questions please do not hesitate to contact me.

Guilty your honour. Most non radio travellers here want to hire a radio that will get them out of trouble. That big red RFDS emergency button is very important to them. Even if they never open the case, there's a feeling that if anything goes wrong, one press of the button and help will arrive.
I'd hate to be peddling them insurance that was worth as much as a domestic insurance policy :-)

Well mine worked, Adobe Reader ver 6.0.
File is 131 pages including Amendments 1 to 4 and all circuit diagrams (A3 foldouts split into A4, join the edges, format.) for 6801 mk2 and 6801-S mk2.

Sam

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-12-04 06:47:41 UTC
From: Jim
Topic: 2191 Message: 2191

Desperation time. I have been searching the world (!) for a couple of old Phillips IC's, OM345. These were commonly used in mast head preamps and distribution amps. It's is a hybrid type of SIL device with perhaps 5/6 legs Just wondering how big people's junk boxes are out there. (If you can find I can pay :)
Apologies to the list.
Cheers
Jim

From: Brian
Topic: 2175 Message: 2195

If QLD are anything like NSW they'll all be crushed so they can't be used on the Police network. Some people just never learn that it is just another commercial radio on the market capable of making itself useful in hundreds of different applications.

I don't know what Codans stand is on their equipment, but I know Motorola favours the crushing of their radios. The reason being is that the market doesn't get flooded with used Motorola radios, therefore they have a better chance of selling people a new Motorola and making more money on them.

Those words aside, if you do here what is going to happen to them, and they are going for sale or auction somewhere, I would definitely be interested to know where and when it's going to happen.

Brian.

2202. RE: [codan_outback_radio] 9323 on ebay

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-12-05 08:44:36 UTC
From: Craig Huxley
Topic: 2175 Message: 2202

Hmm I reckon I can find out .... however I do know the finding for the QPOL BGT upgrade has been shelved due to the digital roll out and a new start date is not stated. So don't go holding your breath. They were on trade back to Codan so they may keep the best for resale or ship them OS to 3rd worlders.

Cheers

Craig

| Subject: RE: [codan_outback_radio] 9323 on ebay
|
| If QLD are anything like NSW they'll all be crushed so they can't be
used
| on
| the Police network. Some people just never learn that it is just
another
| commercial radio on the market capable of making itself useful in
hundreds
| of different applications.
|
| I don't know what Codans stand is on their equipment, but I know
Motorola
| favours the crushing of their radios. The reason being is that the
market
| doesn't get flooded with used Motorola radios, therefore they have a
| better
| chance of selling people a new Motorola and making more money on them.
|
| Those words aside, if you do here what is going to happen to them, and
| they
| are going for sale or auction somewhere, I would definitely be
interested
| to
| know where and when it's going to happen.
|
| Brian.

2204. new web page

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-12-06 00:12:04 UTC
From: Ben Hobson
Topic: 2204 Message: 2204

New web page to look at.
http://ozradio.wireless.org.au/28s.htm
explains the differences between the marine & land based 8528

Also have updated the 9323 page with a picture of the elusive X-2 codan.
cheers
ben

There is always something missing. Like an 8422 manual which I hope to get about April next year :-))
Mind you I do have a 6924 marine radio manual and a few things that even you don't have.....how about a brand new pamphlet for a 8528.....

From: Matt
Topic: 2204 Message: 2212

How about information on the 4000 series marine radio?? I have picked up one, but unfortunately the cables and the tuners were in another box. All is not lost however as I have also picked up one of the 400 watt marine tuner boxes a couple of years ago. I have worked out that it needs a 24V system (so I haven't tried it with 12V), but the lack of cables to connect between the head and the RF box has had me a little hesitant to proceed much further. From the peeking and sneaking that I have so far done inside the boxes, I have worked out that there is one, probably two mini coax cables within the connecting cable, so have not tried a standard parallel cable. No EPROM makes it a little hard to do all that much as well.
Earlier this year I remember that someone was looking at how to modify the 4000 series radios for the amateur bands, cannot remember if it was on this group or not, but I would like to hear from anyone who has some information on the radios - be it for amateur use or not.

Matt

There is always something missing. Like an 8422 manual which I hope to get about April next year :-))
Mind you I do have a 6924 marine radio manual and a few things that even you don't have.....how about a brand new pamphlet for a 8528.....

New web page to look at.
http://ozradio.wireless.org.au/28s.htm
explains the differences between the marine & land based 8528

Also have updated the 9323 page with a picture of the elusive X-2 codan.
cheers
ben

VNG has closed. You are basically stuck with:

(a) WWV & WWVH; or
(b) a secondary standard, such as a TV-derived reference where the teev station is locked to a suitable LOCAL standard (not locked to the network).

Hope this helps

Peter

There is also a kiwi endeavour where there is a number of 80m transmitters that are used for a time reference system. Supposed to be very stable on TX, so you should be able to use these as well. I don't have any other information, but if you do a search on the web, you might get lucky and find it,

2217. Re: Radio Frequency Standard

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-12-06 21:25:11 UTC
From: David Wilkins
Topic: 2217 Message: 2217

Hi Ian and the Group
There is a real problem with the demise of VNG at the end of 2002 and the inaccuracy of WWV/WWVH with propagation problems into the South Pacific.

Murray Greenman ZL1BPU and a number of other amateurs in NZ and Oz have started an alternative set of transmissions with frequency sources referenced to GPS (or standard derived frequency sources such as the TV synch pulse). A couple of Australian amateurs have now built the microprocessor driven transmitter (the micro is the exciter) and have been operating on a range of frequencies at different times.

Information on Murray's initiative and an introduction to precision reference signals can be found on his web site:
http://www.qsl.net/zl1bpu/micro/Precision/. If you need to have ongoing access to the schedule then I suggest an email to Murray will get you added to a weekly mailing list for updates on the "duty" transmission for the weekend.

As a first step listen out for Mike VK2BLR, who has been running a transmission on 3610 kHz CONTINUOUSLY for the last six weeks or so. Mike transmits a VNG-style signal with seconds ticks and all, using an external high-level AM modulator on his ZL1BPU style Exciter and Power Amp. Ultimately he intends to transmit the full VNG time code, so that the signal will be useful for radio clocks.

Transmitter power - 3W, AM modulated
Frequency - 3610.000kHz
Callsign - VK2BLR
Reference - I am not sure but I believe he may be using a 100 Hz reference derived from a Navman Jupiter-T GPS unit.

By using the reference transmissions you are able to track ionospheric Doppler effects and other perturbations down to an accuracy of parts of a Hertz using PC soundcard based software as well as checking local oscillators for accuracy. A lot of information about how to do all this is explained on the web site.

The whole field of ionospheric effects is quite fascinating and includes such things as "gravity waves" (actually audio frequency buoyancy oscillations in the ionosphere due to physical disturbance from the atmosphere). There is also a group of enthusiasts tracking "chirp" sounding transmitter signals (used to sweep the HF band to obtain real-time LUF and MUF data) primarily for military and commercial HF path analysis and adjustment of LUF/MUF predictions. The output of those experiments has required the development of specific software that scans HF from 2 to 30 MHz in phase with the sounding transmitters and gives an output showing signal delays, multipath reflections involving the E and F layers in the ionosphere and D layer absorption.

So to answer your question there are now alternatives to VNG though they do not have the official stamp of approval of NATA or other laboratory accreditation scheme. So good luck with the checking of your service monitor. If possible I would suggest you use the PC soundcard software approach as it plots the signals very accurately and you can see the multiple traces, of HF reference and target oscillator) all on the same screen though you may need two receivers to detect the two sources. I have used the software to check receiver stability and drift (especially at turn on) and you can see diurnal drift effects due to temperature changes etc. You would be surprised to see what some oscillators do.

Regards
Dave Wilkins ZL1MR

Actually heaps of the X-2 radios were sold into PNG.
Very simple to use and robust, though a bit basic on features.
Add a selcall mic and they do pretty well.

Most capital City TV stations have a rubiduim locked sync and colour
burst subcarriers, there was a electronics australia project a few
years ago based on a video to freq standard reference.

Also i have seen a projects based on OEM GPS modules with a 1 pulse
per sec output via a micro controling a VCXO, claims can get short
term drift within few parts per 10^8, (few hertz at 100s of Mhz)

If you can tolerate a few Hz or so within Millions, the ABC AM
Boradcasts are within that range.

Regards

2221. Frequency References

Yahoo group: codan_outback_radio (1997 — 2004)

From: David Wilkins
Topic: 2221 Message: 2221

Frank and Ben
Well this isn't really much to do with Codan's exactly. Still frequency and time measurements are fundamental to all radio technology.

When setting up test equipment the old rule of thumb I was taught is that your reference needs to be 10 times more accurate than what you are measuring, and so on for each reference as you move back up the chain. So Ian needs to have as accurate a signal as he can get to set up his equipment.

Yes you can use the TV synch pulse which is locked to a frequency standard. Not too sure if it is terribly safe to have loose wires floating in and out of a TV set. Easier to take the signal out feed from a video tuner and use the appropriate chip to pull out the pulse. See:
http://www.qsl.net/zl1bpu/micro/Precision/Reference1.htm

Currently in NZ most TV signals and the CDMA phone network use GPS synch pulses as the accuracy/stability of the GPS is based on the world time standard. The rubidium standards appear to be dropping out of use as they wear out or become too costly to maintain.

If you have a read of the NIST data on the US/World time standard you will find that the GPS constellation is used as the world wide reference for the laboratories who participate in setting standard time and frequency. Given the fact that each satellite has a couple of atomic clocks in them the accuracy of the handheld GPS time base is pretty good once everything locks up.

Have a look at the info and links at the US National Institute of Standards and Technology (NIST):
http://www.nist.gov/public_affairs/releases/n99-22.htm
it all makes fascinating reading especially the description of how the NIST-F1 Caesium fountain clock works.

Have fun though I doubt if the user of an old HF Codan will ever notice if a few Hertz's go missing here or there.

Dave ZL1MR
(by the way I do have a 6924 Mk2 so I have a reason to be here)

Gary
as has been discussed many a time in this forum, Please dont ask/offer software for codan radios. Codan put a lot of time & money into creating a fantastic radio and software to go along with it. NGT and 9323 software has not been released to the public and probably never will. The 8525/28 software is out there, Codan are not overly happy with this but accept it.
For your info the software is a reasonable outlay for a dealer to purchase & I'm sure that they wont let it get out and do themselves out of business. If you dont agree with this, think again what a fantastic radio you are using and how much effort was put into developing it.

No more discussion will be entered into on this subject or I will remove the member without further warning.

AR Voice also does not have AM
AR Voice has no Junction Box, but you can still connect a GPS
AR Voice has a pretty Yellow screen!
You also cannot have multiple control points, nor use a Remote control system, no data / fax modem, no RS232 control of the radio.
I am not sure if the Amateur option is available for AR Voice
The AR Voice is certainly easier for vehicle installations than the AR. It should be a deal cheaper than the AR. This is after all the reason for its existence!

Sure, with the link in place you can add/remove Tx channels, but unless the NGT is programmed, you cannot remove any admin level password and implement other features such as the enabling of LSB, or the amateur option. Also, a complete programming allows the proper relationship to be set up between the address list, channel list and phonelink list. I think NGT users are best to pay a Codan dealer to program it to exhibit the features they want with all the lists set up properly and every year or two to upgrade the software to reflect software improvements, bug fixes and the like,

G'Day Larsens, [for the want of a first name?]

I'm after the software as well if you end up getting it please?

You can place new channels in the NGT one at a time by fitting a link in
the small box that the mike goes too etc.

Regards
Terry

2235. 9480 scanning function?

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-12-11 07:05:31 UTC
From: hb9dsp
Topic: 2235 Message: 2235

I would like to start the scanning function of my codan 9480 but get the message of wrong configuration! any idea?

Or maybe some onje can provide me a copy of the user manual? (I will cover all cost :-)

Thank you very much in adavance for any feedback

Best 73's from cold Switzerland (-6°C)

Ferdy [HB9DSP]

2236. Twoway, Broadcast and Amateur Frequency List

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-12-11 11:27:52 UTC
From: Mike Richter
Topic: 2236 Message: 2236

I seem to have spent ages compiling an up-to-date list of frequencies so I can be sure I get the right frequencies programmed into my 9323.

I have organised the channel numbers into three groups so that I can scan the frequencies in three separate groups.
Twoway - 0001 to 2999
Receive-only - 3001 to 5999
Amateur - 6001 to 8999
27 Meg - 9001 to 9999

For twoway the channel number is the frequency without kHz digit
For receive-only the channel number is 3000 plus the frequency without kHz digit
For Amateur the channel number is 6000 plus the frequency without kHz digit.

This way you can work out the approx freq from the Channel Number and you work out the Channel Number if you know the frequency.

I have included the Fax transmissions from Charleville and Wiluna at 1kWatt as a way of monitoring propagation conditions so that what is the best frequency to call on.

I have searched far and wide to make sure the frequencies are current, however looking at websites is not reliable - even the phone number for WA on RFDS is a year out of date. I eventually phoned up the bases to get the correct frequencies.

The file is saved to the FILES section of the Yahoo group.

Mike

Ferdy,

I gather the 9480 is a variation of the 9323, but I have no details about what it can do.

Would you be able to post a picture in the photos section?

Activating the scanning function may be able to be done through the menu or may require the software...not too sure.

Cheers and good luck...

Mark

Ferdy
The 9480 was released around the same time as the 9323 but is really a
rehashed 8528 with only 15 channels, different head and ability to be
programmed via the XP software
sounds like you dont have any channels in the scan table.
try this (method for 8528 ---may work)

press ENTER followed quickly by SCAN (if you get an error see below]
selct the channel you want to scan, eg CH 1, press SCAN
select next channel, press SCAN etc up to max 8 channels
when finished press ENTER, followed by SCAN again
then press scan, it should start....

if you get a message saying scan inhib or similar try this.
turn off radio, while holding down SCAN, turn it on. press SCAN and the
display will keep scrolling thru. when you see something like PROG
ENABLE, SCAN AUTO then press ENTER and turn of/on the radio and try to
enter scan channels again.

Download the 8528 manual from here
http://ozradio.wireless.org.au/8528.htm it may be of use... [someone
want to shed some more light on this radio ...hint hint..]

2245. 9323 Software

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2003-12-15 20:45:11 UTC
From: waustin67
Topic: 2245 Message: 2245

How can I check whether my 9323 has an up to date version of the operating software. I've recently purchased it second hand.

If it is an older version (which I think is the case from looking at the manual I downloaded from the ozradio site - thanks!) how and where can I get it updated. Currently living in the Pilbara but will be travelling through Kalgoorlie, South Oz and then to Ballarat in the next 10 days.

Radio works well on all frequencies I've listened to and I've become a member of VKS737 (Whiskey 2719 Selcall 2719) to give me that "peace of mind" when out remote areas.

Any help appreciated.

Wayne

Wayne,

The only way I know of checking this is with Codan Tech dept. Some where in the manual will be the phone number. They would be best to assist.

I have an older version of the 9323, but I am not aware that the newer versions had any different features available in any updated software ('firmware') versions...still essentially the same functions.

Sorry I can't be more help, but others may know if there are any 'additional' benefits of updating the firmware.

Cheers,

Mark

Press the mode button 5 times then use f2 to scroll through the info
and follow your nose. the radio shoul be 4.35 or abouts and the
control head 4.31

I currently have a 8528 that has the 27meg CB band programmed into it, Starts at channel 1 and allows transmit to channel 40 (27.405) when entering direct from keypad it will not allow transmit on anything above 27.405. I was wondering if there is a file available to allow it to transmit on frequencies above, ie 27.500 etc. I have been told that this cannot be done, Can anyone direct me to or send me a file to enable this ..
I have my own eprom programmer and software I just need a file if available
Thanks & I hope everyone had a merry xmas

Sorry to advise, but it appears that Codan have deliberately made it this way to prevent pirating on the portion between 27.405 and 28 MHz. I am yet to hear of anyone being able to set it for coverage of any of the 10m freqs. It would be nice, but as far as I am aware, no go.

Matt

Subject: [codan_outback_radio] Codan 8528

I currently have a 8528 that has the 27meg CB band programmed into
it, Starts at channel 1 and allows transmit to channel 40 (27.405)
when entering direct from keypad it will not allow transmit on
anything above 27.405. I was wondering if there is a file available
to allow it to transmit on frequencies above, ie 27.500 etc. I have
been told that this cannot be done, Can anyone direct me to or send
me a file to enable this ..
I have my own eprom programmer and software I just need a file if
available
Thanks & I hope everyone had a merry xmas

Which burner are you talking about?? I have been looking for an eeprom burner for quite a while, and if reasonably priced, I may well be tempted to purchase same. Really annoying making up a file for a chip and then having to wait a fair while whilst I get a friend to burrn the appropriate chip. A burner that I control would obviously alleviate this problem for me.

Good day, afternoons, or night

I am from El Salvador in America Center and is the first time that I write to the group with a consultation:

I have a dipole antenna CODAN C411 and which I have problems with the Toroid Transformer, apparently a electrica unloading it damage and has burned the copper wires.

If somebody of the group has the diagram of the same one and me it provides it to him will be been thankful very.

And wishing best desires for the 2004 for the group

Kind greetings from El Salvador

Salvador Garcia

Are you talking about the new windows based version that was described recently or the older one from years ago. The software for the new one should be on silicon chips website, www.siliconchip.com or similar . I have the software for the old one if you need it.
If you havent bought one yet, go for the silicon chip windows based one. it will program a lot more devices and will eliminate the need to dig up an old '486.

Buenos días, Salvador.

Puedes hablar con el Señor Peter Leonard de la empresa Lencom
Antennas en Adelaide a cerca de tu antena.

Lencom Antennas fabríca las antenas de alta frequencia para
Codan.

Su email - peter@lencomantennas.com.au

Vivi en Santiago de Chile durante un año, por eso hablo Español
muy
malo :-(

Un cordial saludo,

Chris

Matt

Dick smiths sell the eprom programmer kit for $130, i have only just completed the kit and carried out the mod to programm 27512 eproms, I have attached a copy of the front page of the article as bitmap if you zoom in you should be able to read it. I am still hunting for those old 486 mother boards that i put away about 10 years ago thinking i might use those eproms one day

I've heard that it's not an expression that Padj drivers like :) Used to have a Padj but "modified" it on the Cape. Ahh, all I needed was a bit more ground clearance...and power...and room...and vroom. Nice car but not off the tar.
There were several reasons for my adoption of diesels years ago. I have to admit that the lack of RFI was a huge factor. Mind you in the HJ60 I did put a switch in the oil sender sensor line. HF on, switch off. Pity that one can't test drive new vehicles with a HF under the arm. Some of the newer diesels have horrendous RFI probs.
Cheers
Jim

"Some of the newer diesels have horrendous RFI probs." - but not if you buy a Pajero !

I've just put the 9323 in a Pajero NP DiD and I can't tell if the engine is running or not ! That includes listening from 0.5 to 27MHz.

I'm certainly happy with the 9323 also - made contact to Italy and scotland on 20 metres using a 4metre vertical (not while driving !)

The only disappointment has been not hearing much on VKS737 - but I haven't been listening on the sched times.

I ended up building my own rear antenna mount out of Aluminium because the commercial ones aren't compatible with the Tyre Cover. I'll put up photos shortly.

2269. 8528 selcal

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-01-02 22:15:40 UTC
From: ozvic
Topic: 2269 Message: 2269

Happy new year everyone!

Got myself a Codan 8528 to play with. Did the mods in the files section of this group and it works fine. My problem is I can't send a selcal if the leading digit begins with a zero. ie If I wish to send a selcal of 0349 only 349 appears in the display. If I punch in 0000 only 000 apears in the display.
As I want to test some beacons which have a leading zero
I guess the zero has to be shown on the display.
Any 8528 owners with suggestions?
Vic

Vic,

Don't worry about this, it is normal. All Codan radios, including the 9323 automatically put the '0' if only 3 digits are entered. On Bxxxett radios you need to put the '0' in.

All the best with it.

Cheers,

Mark

Mark,
Thanks for the info. I did manage to receive a Beacon call back with 3 digits shown on the display and leading zero missing from display. Unusual that it won't display the leading zero!
Vic

Hello all on the Codan group, I'm a newbie here so I'll come to the point.

Does anyone know a source for the 10V regulator on the 852x motherboard, labeled OM788.
Nobody in the whole wide world has ever heard of this part number.

The engineer at Codan who specified this part wants his butt kicked.

Thanks Richard

Jim,

The fault does not normally occur at switch on. Normally I notice them faulted after they have been on for a while. I have seen them fault anywhere from 15 minutes to a few hours after being switched on. The fix is to cycle power and I have occasionally seen a radio fault upon cycling power.

Thanks,

Charles in Baghdad

Subject: RE: [codan_outback_radio] NGT SR Faulting

Jim,

The fault does not normally occur at switch on. Normally I notice them
faulted after they have been on for a while. I have seen them fault
anywhere from 15 minutes to a few hours after being switched on. The fix
is to cycle power and I have occasionally seen a radio fault upon
cycling power.

Thanks,

Charles in Baghdad

Hi Charles, when does this fault occur , at switch on ?
Cheers
Jim

Subject: [codan_outback_radio] NGT SR Faulting

Hello to the group,

Has anyone had any experience with the Codan NGT SR radio? I have a
few
that are faulting. The normally green LED on the radio unit turns red,
the receive audio pumps and the transmit audio consist of a pumping
squeal. I don't have an answer from Codan yet.

Charles in Baghdad

I agree... I have had several occasions to ring Barrett re problems and they have been more than helpful with information regarding any problems that their radios may have.

ozvic.

Hi there probaly using a 8volt regulator and a voltage devider to raise it
to 10V. Given the part number you said you could try a 7808 from dick smith

etc. cost ~$1.30 or a 9volt 7809. Most ccts wouldn't mind if the voltage was
a bit low.

Phil

Hello all on the Codan group, I'm a newbie here so I'll come to the
point.

Does anyone know a source for the 10V regulator on the 852x
motherboard, labeled OM788.
Nobody in the whole wide world has ever heard of this part number.

The engineer at Codan who specified this part wants his butt kicked.

Thanks Richard

2280. Re: Codan 852X motherboard 10V regulator

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-01-05 23:29:57 UTC
From: Mike Richter
Topic: 2272 Message: 2280

Using an ordinary 10 volt regulator is not a good idea because they need two volts for reliable operation. So whenever the voltage drops below 12.0 volts (which it will on current peaks) the regulated voltage will drop slightly, affecting frequency and/or gain.

I suggest using a Low-Dropout Regulator which can work with 0.2 volt drop. Dick Smith sells LD1117 or LM2941 Adjustable Low Droput regs.

Yes, well, a 9 volt regulator seems to work OK.

It doesn't do to encourage Codan to use bodgy parts by going and buying them off Codan at inflated prices.

Much better to fudge it, with a bush repair job, using secondhand parts! After all this is an outback radio group!

Thanks all for the advice.

Richard,

I met the Codan Sales Manager a couple of months ago, and he went to pains to get me to buy components elsewhere than Codan, saying that they had to put on a markup and he would rather that I paid less.

One of their people emailed me a couple of days later with the details, so I am very happy with their service - dunno who the other bod just down this thread rubbed up the wrong way!

I reckon that this is pretty normal for manufacturers these days, as they have to recover their costs of stocking components, especially those for discontinued products.

Jim

G'day All,
I'm a new subscriber to this list so my apologies for asking questions that have probably been covered several times in the past.

I'm currently looking around to purchase my first HF radio and would appreciate some names and contacts from suppliers who can also install, test and give training. I'm in Newcastle and can get a new unit locally but obviously would prefer the cheaper option of a good second hand reco'd model and am prepared to travel if the service and price is worth it.

We're starting a trip in July so would like to get up and running in the next few months to get used to it before we go.

Also does anyone have any advise or tips on installation in a 2000 model Jackaroo.

Cheers,
Barry

Hi,
Cant offer advise for supply of radio's in Australia but I do have a 2000 Isuzu Bighorn which you guys call a Holden Jackaroo over there. The electronic injection/ computer system used in these vehicles kicks up all sorts of noise and interference which will need to be addressed and overcome before you will be able to successfully use your HF set while the engine is running.

Lake Macquarie Communications is up your way. Not sure exactly where, but they are on the net. They sell Codan NGT etc, and I am bias towards Codans.
Friend bought an NGT from them, and like you, he was inexperienced. I believe they do a training session with you on them. They also run a bush telephone system where you can use your HF radio like a phone.
I have no affiliations and am not recommending them whatsoever, just letting you know my friend was happy.

Hi Barry, there's some good info in other posts re sourcing and that Jackaroo of yours.
With comms it's the same old story, you get what you pay for.
Where are you travelling, do you really need remote area comms ?
Radio or Satphone ?
How much do you want to spend?
Buy or hire ?
There is a good booklet for newbies availiable through the 737 network. You might find some more info on my website http://www.jimshire.aussiewide.com/. Yes it's a commercial site but there are bits there that may help you to make an informed decision.
Cheers
Jim

From: BONNING, Barry
Topic: 2295 Message: 2299

Hi Keith,
I've spoken to the guy at LMC and they are just up the road from my
place. He is very helpful and knows his stuff and if I have to buy new
will go thru him.

Cheers,

Barry

Barry
Lake Macquarie Communications is up your way. Not sure exactly
where,
but they are on the net. They sell Codan NGT etc, and I am bias
towards
Codans.
Friend bought an NGT from them, and like you, he was
inexperienced. I
believe they do a training session with you on them. They also
run a
bush telephone system where you can use your HF radio like a
phone.
I have no affiliations and am not recommending them whatsoever,
just
letting you know my friend was happy.

Subject: [codan_outback_radio] Newbie

G'day All,
I'm a new subscriber to this list so my apologies for asking
questions that have probably been covered several times in the
past.

I'm currently looking around to purchase my first HF radio and
would
appreciate some names and contacts from suppliers who can also
install, test and give training. I'm in Newcastle and can get a

new
unit locally but obviously would prefer the cheaper option of a
good
second hand reco'd model and am prepared to travel if the
service and
price is worth it.

We're starting a trip in July so would like to get up and
running in
the next few months to get used to it before we go.

Also does anyone have any advise or tips on installation in a
2000
model Jackaroo.

Cheers,
Barry

G'day guys and girls

Having not so recently purchased an 8523, and being able to drive the basic functions, I'd love to get my hands on a user manual. Can anyone point me in the right direction???, not fussed if it's paper or electronic, and would consider paying a small amount of $$ if required. The codan website is ok, provided you have a NGT, but not anything else. anyway, lookforward to your repleies,

regards,

shaun

2309. Fraud Warning

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-01-29 21:49:51 UTC
From: Jim
Topic: 2309 Message: 2309

I recently put a bid on a Codan radio on Ebay. I was contacted by a "gentleman" purporting to be in Spain and offering me the same radio at a significantly lower price. As a result I sent him a copy of the webpage content at http://home.iprimus.com.au/jimshire/scam.html
I also reported his actions to Ebay.
This kind of fraud is rampant on the web.
If you are considering buying a radio (or anything else for that matter) please be careful.
Most transactions on Ebay are completed honestly and to the satisfaction of both parties.
If in doubt ask around about the vendor. Don't take their feedback as indicating much as the feedback can be easily fudged, especially if the items sold or bought are low ticket items.
Don't get caught. Some sellers refer to buyers as "punters" for a very good reason.

Cheers
Jim

From: Brian
Topic: 2308 Message: 2314

Peter if it is simply the screen bleeding (which it sounds like it is), it will be a relatively easy fix. If the radio is still in warranty, which of course it sounds like it isn't, it would be even easier.

I'll take the bet of it being out of warranty and say just take the headset to a Codan agent (or send it back to Codan) to have the screen replaced. Depending on how much needs to be replaced (I've never had one pulled apart) and how much Codan decided to slap on the cost for parts and repairs, it will still be a lot cheaper than buying a new head for the radio.

Brian.

2315. Some of the Aerial Mounts I've now seen

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-01-31 02:37:19 UTC
From: Craig Huxley
Topic: 2315 Message: 2315

Hi all,

I'm currently in Timor and thought I shoudl report on some of the gear I have seen in use.

It seems that Codans are not the only thing used by the UN anymore. I have seen quite a few Barrett on vehicles. Most of Codans are NGT's though.

Some of the aerial mounts are interesting as bullbars are not that common. On a Hilux Surf I saw yesterday the mount was a lump of 10mm plate sticking through a gap under the bumper....I guess its effective enough. Another reasonably common mount is what looks like a piece of 3" pipe with a plate welded on top off the bumper on some of the utes. Looks like pedestrian safety is not quite as high on the priority list as it is in Aus.

None of our vehicles (CIVPOL) have Codans at all just VHF radios so can't tell you how well they work here in the mountains.

Cheers

Craig

2317. Re: [codan_outback_radio] Some of the Aerial Mounts I've now seen[Chat]

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-01-31 03:18:41 UTC
From: Jim
Topic: 2317 Message: 2317

I'd better explain my last post re Bernard, Codans and thos B#$$#tt things. He was a mate of mine while he was in Oz years ago. He would habitually force huge amounts of booze down my throat while using my amateur callsign "under supervision". As he only spoke French on the radio the supervision was a bit lacking at times.
I was dragged to a traditional French Xmas celebration by Bernard who couldnt remember who I was by 11am. Neither could anyone else but it didnt stop the booze (accompanied by a kiss on both cheeks from the females AND males.....yeah right)... flowing.
Bernard was last heard from as a senior radio tech for the UN in the middle east somewhere....maybe that explains some of the trouble there :)))))

Cheers
Jim

Years ago one of the UN's top radio blokes was a Frenchman by the name of Bernard. If he's still with them it's no wonder they have Barretts :))))

Cheers
Jim

Subject: [codan_outback_radio] Some of the Aerial Mounts I've now seen

Hi all,

I'm currently in Timor and thought I shoudl report on some of the gear I have seen in use.

It seems that Codans are not the only thing used by the UN anymore. I have seen quite a few Barrett on vehicles. Most of Codans are NGT's though.

Some of the aerial mounts are interesting as bullbars are not that common. On a Hilux Surf I saw yesterday the mount was a lump of 10mm plate sticking through a gap under the bumper....I guess its effective enough. Another reasonably common mount is what looks like a piece of 3" pipe with a plate welded on top off the bumper on some of the utes. Looks like pedestrian safety is not quite as high on the priority list as it is in Aus.

None of our vehicles (CIVPOL) have Codans at all just VHF radios so can't tell you how well they work here in the mountains.

Cheers

Craig

Isn't that interesting. You can't GIVE someone a copy of XP you can SELL it ? . Does that mean that the permission to use it (or whatever the legal term is) that one purchases XP is transferrable ? Hmm...legalities are a PITA. :))

Cheers

It's Terminal for the LCD Display - it has gone leaky.

But it should be no problem for Codan to replace it

2331. Comms for remote travelling - summary

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-02-01 10:47:58 UTC
From: Mike Richter
Topic: 2331 Message: 2331

Maybe I'm preaching to the converted here, but this answers a few questions asked on another group about Comms for remote travelling -

EPIRB - absolutely essential, can be used if Satellite/HF/UHF fails

UHF - important to get road and safety info from other travellers within 50km

Satellite - call from anywhere. Safety watch via relatives or Police. Call costs.

HF - call from anywhere, with occasional blackouts. Talk to others over any distance. Safety watch via VKS737. No call costs. Phone via Radtel.

Mike

Subject: [codan_outback_radio] Comms for remote travelling - summary

Maybe I'm preaching to the converted here, but this answers a few questions asked on another group about Comms for remote travelling -

EPIRB - absolutely essential, can be used if Satellite/HF/UHF fails

UHF - important to get road and safety info from other travellers within 50km

Satellite - call from anywhere. Safety watch via relatives or Police. Call costs.

HF - call from anywhere, with occasional blackouts. Talk to others over any distance. Safety watch via VKS737. No call costs. Phone via Radtel.

Mike

From: waegeler
Topic: 2334 Message: 2334

I have just finished building a DSE EPROM Programming kit, with the intention of channel optimising my 8528.
I am able to read EPROM DATA alright, but on programming it falls over with a fault about a third of the way through.
It all checks out as per the documentation supplied and I have tried various parallel port configurations to see if there is any improvement. Unfortunately I have not had much success. Has any one else experienced simmilar problems and was able to resolve them?

Cheers

Jim,

I have the circuit diagrams for this ancient beast. I'll happily scan them and send you pdf files against your promise to donate $20 to a relief charity of your choice.

regards

John

2341. Re: [codan_outback_radio] DSE EPROM PROGRAMMER

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-02-03 22:56:31 UTC
From: Paul
Topic: 2334 Message: 2341

Hi Rob,

It has been a while since I looked at my DSE programmer and I did have some troubles at first but I was able to resolve them.... but I cooked a few eproms in the process. I cant remember exactly what I did now as it was 3 years ago.

Some quick and maybe even silly questions-

1. have you performed the modification for 512k eproms? - this enables the programmer to access the higher address' (if you can read then I assume that you have)

2. Have you tried experimenting with different write pulses/timing etc. I used the test file to determine errors etc and a hex editor to view the data. (the fact that you are programming OK to about a third of the way through I would suspect the write pusles are OK??)- are you able to read the eprom you have programmed and compare the data to where it is corrupted-is it error free??

3. Have you been able to successfully write any eproms with the test file yet- eg a 64K eprom...I found these the easiest to program. If not check the hardware- I had a faulty IC but I cannot remeber which one now as it was a long time ago.

I seem to recall that I had similar problems but after replacing the IC and trying different settings(write pulses etc) it worked out OK.

There is bit of info available on the net regarding programming different eproms etc, I have had to experiment with mine to be able to program different eproms.

Regards

Paul

Looks like a cheap base aerial. Not sure how this particular one performs
but worth finding out for the price?
http://cgi.ebay.com.au/ws/eBayISAPI.dll?ViewItem&item=3075967491&category=29
6&sspagename=STRK%3AMEBWA%3AIT&rd=1

Also the genuine BBA100 is availiable s/h for 375 at
http://vkham.jbo.com.au/cgi-bin/classifieds/classifieds.cgi

Cheers
Jim

Thanks for the plug, Jim. I wasn't going to promote it here as I
feel that's a bit commercial, but now it is out in the open.

It's just too big to haul up in my small backyard, otherwise I would
be using it.

Peter

That's the problem with HF - not all that amenable to modern suburban
blocks, or vice versa.

Actually, if you look at the 402 design and this one, you are
immediately struck by the "similarity" - which I'm sure is no
coincidence <nudge, wink>.

2360. Re: Newbie

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-02-08 04:15:20 UTC
From: rangy92
Topic: 2295 Message: 2360

Hi Barry,
My personal preference is for Barrett due to Codan not always being helpful service wise on there older sets. I have had help from very good on one set to "get a new set" on another from Codan.

As for Barrett I have had from good to excellent, with Barrett service standing by there products & even preforming a "factory warranty repair" on a set that was seven years old when the fault appeared.

I now run a Barrett 550R on the vks-737 net. http//www.vks737.on.net It is a good net to be on. If you need more info I can pass a phone number to you of line for one of there net controllers in Sydney. There is also a base in Newcastle that may be of help.

I can not help with a seller as I got my sets from WA & ebay & installed myself as I was a radio tech 20 years ago.

When you do get your set do a radio check once a month to make sure it is still working as it may take up to a month to get the set repaired. A bit late if you leave on your trip in three weeks & your set has died. It will also get you used to running the set & the procedures used during a radio sked.

There is a HF dealer in Sydney but I do not know if they have any 2nd hand units. As for new units Barrett is normally cheaper then Codan but both sets are as good as the other in use. There is also Qmac but I do not know the current pricing of them.

You can get out of it cheaper if you opt for a tapped whip & not an auto-tune antenna but it may limit your channel number. This may not be a problem if you are only using say 5 channels as is used on the vks-737 net.

If you go for a used set make sure that the set has Selcall & the RFDS tone calls fitted as it is now the only way to make a call to a base out of normal sked times. Also make sure it has the channels fitted or programmed for the net you intend to use.

Hope this has been of help.

Cheers
Wayne.

Hello I'm placing this advert for a mate of mine who wants to sell his 9323 codan, it has the TXE option where all the parameters can be programmed via the front of the radio (user programmable) it has not been modified in any way, this is how it left the Codan factory, my friend had this option fitted with the approval of the ACA and various government departments, He has already sold the 9350 and now wants to sell the radio, he wants $1700 for the radio. It is the only 9323 I have seen with this option. Please email me at ihassall@... for anymore details thanks Ian

I ran one for 2 years in the bush without missing a beat. I've since repaired a few quite successfully and they are still in service. Its a matter of money. The 9350 is a far superior beast, faster and on the whole more reliable. (Try whacking it with an emu and see what happens :) It's also one heck of a lot more money. The 8558's go for around 400 and a s/h 9350 might fetch close to twice that. Those of us with 9323's or NGT's tens to forget that there is a budget sensitive market out there. Some people are still using xtal controlled tranceivers and whips. There are still a lot of 8525s and 8528's doing stirling service and a fair few 8558's. The ad option is fast becoming impossible to source for those switching from a whip or whose board has stuffed itself.

Cheers

Jim,

Agreed... I had an 8558 for 5 years and it was in the bush 5 days a week for about 250 days per year and the only problem it ever had was fixed by the 'tap' in the bottom of the tuning section when it didn't want to tune with the new troop carrier. I now have a 9350 and whilst it is much faster, it still has the odd tuning glitch.

Ive had more troubles with early 9350s than 10 year old 8558s. the early 9350s used to break the worm drive coupling if given a smallish
impact. they also tend to rattle this coupling off on rough roads. Codan has fixed this problem now with a new coupling method. True the
9350 is a superiour antenna generally but the 8558s are still in service and will be for a long while yet.
Physical damage to either antenna is the prime cause of failures. electronic/mechanical problems generally are rarer.

what sort of $$$ you after for the AD boards Jim ????

Now the old Moonraker Antenna that I had on the first of the 8525's...that was a different story. That was a dog!!! Bent and buckled whips...would hardly ever tune the first time...made heaps of clattering noises. I was glad to get rid of that one!

2378. Codan 9323 and which battery to connect to ?

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-02-19 03:28:20 UTC
From: bkir01
Topic: 2378 Message: 2378

Afternoon All,

I am in the middle of re organising the engine bay in my Landcruiser (HZJ105) after installing a few more electrical items. The 9323 is currently disconnected, having previously been wired to the deep cycle battery.

Out of interest, what are the thoughts on running HF radio's from either the deep cycle battery or the cranking battery ?

Cheers,

Brian

Brian,
I've set my vehicle up so the cranking battery is purely dedicated for
starting the engine. All other electrical equipment is run from the deep
cycle unit. I've found it to be the simplest and most reliable system.

Hi Barry,

Thanks for the input - whilst my deep cycle is new and tested, as well as the management system for it, I have found that with a 60L Engel, and then a few more bits and pieces hanging off it (or drawing off it) that it tends to struggle a bit, if not driven every day. I have the winch running of the starter battery (must remember to winch only with engine running) and I thought I may move the HF over there as well. My rationale being that if the HF is left on scan overnight, then I doubt that would be enough to cause problems starting in the morning. I suppose I was more interested in hearing feed back from those that may have their HF connected to the cranking battery.

Anyway, a test will soon prove me right or wrong. I fully agree with your thoughts on simplicity - but I cant fit a bigger battery in !

Cheers,

Brian

Its a simple problem. Aux battery maybe hot beer. Cranking battery maybe no go anywhere. QED Attach anything that could drain your starting battery (even if its unlikely, forgetting to turn the radio off isn't that unusual) to the aux battery.

Cheers
Jim

Subject: [codan_outback_radio] Re: Codan 9323 and which battery to connect to ?

Hi Barry,

Thanks for the input - whilst my deep cycle is new and tested, as well as the management system for it, I have found that with a 60L Engel, and then a few more bits and pieces hanging off it (or drawing off it) that it tends to struggle a bit, if not driven every day. I have the winch running of the starter battery (must remember to winch only with engine running) and I thought I may move the HF over there as well. My rationale being that if the HF is left on scan overnight, then I doubt that would be enough to cause problems starting in the morning. I suppose I was more interested in hearing feed back from those that may have their HF connected to the cranking battery.

Anyway, a test will soon prove me right or wrong. I fully agree with your thoughts on simplicity - but I cant fit a bigger battery in !

Cheers,

Brian

2382. Re: [codan_outback_radio] Re: Codan 9323 and which battery to connect to ?

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-02-19 04:51:20 UTC
From: Malcolm at "On- Track 4WD" in Greymouth
Topic: 2378 Message: 2382

I have fitted a second cranking battery in parallel with the fitted one. If I run the fridge and the HF set for 2 days, which equates to about 4 Amps per hour, after 2.5 days with the motor not run much both batteries will be flat. I myself would have the HF set connected to the cranking battery and everything else connected to the deep cycle battery. The synthesised sets draw about 400 to 500 mA which equates to about 1 amp every 2 hours. Although the cranking battery may deliver around 350 to 400 amps cranking it will only do that on a fully charged battery. It does not take long (couple of days) with only the HF on to flatten the battery below what the solenoids for the started will not operate. Although you may not have drawn 300 amps out of the battery the voltage will have dropped below what the solenoid needs to operate the starter.
Maths says set drawing 450 mA = 10.8 amps per day.
Anyway, that's my 2 cents worth.

Jim,
Yes,. forgot about the likelihood of leaving the radio on by mistake :-)) done that too. It takes about 22 km at 2500 rpm to recharge a battery with what is used to start it. Flat battery = lots of Kim's and revs to recharge it. Starting battery and aux battery flat = walk :-))

Anyone who uses eBay be aware of any email that looks official from eBay
and asks for you log in details. Ebay will not ask you this kind of
info. disregard the email, its password harvesting... and forward it to
spoof@... for investigation.
a typical email might read like this...

[begin scam email]
We regret to inform you that your eBay account could be suspended if you
don't login into your account. If the
security issue could not be solved your account will be suspended for a
period of 3-4 days, after that it will be again
operational.

Per the User Agreement, Section 9, we may immediately issue a warning,
temporarily suspend, indefinitely suspend or
terminate your membership and refuse to provide our services to you if
we believe that your actions may cause
financial loss or legal liability for you, our users or us. We may also
take these actions if we are unable to verify or
authenticate any information you provide to us.

Due to the suspension of this account, please be advised you are
prohibited from using eBay in any way. This
includes the registering of a new account.

Please note that this suspension does not relieve you of your
agreed-upon obligation to pay any fees you may owe to ebay.

Regards,

Safeharbor Department
eBay, Inc.
[end scam email]
the above text will be followed by the ebay logo and a login that looks
like ebays. Advice from ebay is to change your password immediately if
you happen to fall victim to this email.

cheers
Ben (no they didnt get me)

2385. twin batteries

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-02-19 05:28:08 UTC
From: Ben Hobson
Topic: 2385 Message: 2385

Brian
Unless you happen to work for our fleet fitout contractors fit all accessories such as radios, fridge etc to the second battery. The interface box ibetween the two batteries is designed to disconnect the auxillery battery from the main one if it starts to run down. this is to preserve the main crank battery. A deep cycle is a good choice (unless you are our fleet fitout contractors) as it is designed to be discharged to a lower point than a crank battery. deep cycle batterys are designed to deliver a constant, relatively low load over many hours. Crank batterys are designed to deliver several hundred amps in a few seconds. If you discharge them a few times they are usually knackered.
If your deep cycle battery is going flat, you need more capacity. Look around the choice is endless, you want one with the highest amp/hour rating you can find, within the constraints of the finance minister and the physical space under the bonnet.
Quick word on amp/hour rating.. eg a 100amp/hour battery will deliver 100amps (you could weld with it..) for one hour before it will be discharged. Conversley the same battery will deliver 10 amps continuosly for 10 hours etc..
I would be inclined to hook the winch up to the main battery as its load requirements are more like the starter motor, high current in short bursts (read the book, your not supposed to run it until the terminals melt off.. :))
cheers
ben

From: Paul
Topic: 2372 Message: 2389

I run a option AD with an 8551 (moonraker) and until recently I have had no trouble with it. The heat seems to of made the tune button on the control head not work (as well as the scan and clar up/down buttons)- but in the morning when it is cold it works again. anyone have a spare 8525 control head??

The only thing that I have noticed is that the stepper motor runs in one direction which may be after the moonraker has no further travel on wormdrive and just "clicks" until the motor is run in the opposite direction. every so often it may time out if this occurs, just a re tune and it is tuned. mind you the right antenna designed for the option AD would be nice

Paul
Mark <marke01me@...> wrote:
Now the old Moonraker Antenna that I had on the first of the
8525's...that was a different story. That was a dog!!! Bent and
buckled whips...would hardly ever tune the first time...made heaps
of clattering noises. I was glad to get rid of that one!

Subject: Re: Option AD

I ran one for 2 years in the bush without missing a beat. I've since repaired a few quite successfully and they are still in service. Its a matter of money. The 9350 is a far superior beast, faster and on the whole more reliable. (Try whacking it with an emu and see what happens :) It's also one heck of a lot more money. The 8558's go for around 400 and a s/h 9350 might fetch close to twice that. Those of us with 9323's or NGT's tens to forget that there is a budget sensitive market out there. Some people are still using xtal controlled tranceivers and whips. There are still a lot of 8525s and 8528's doing stirling service and a fair few 8558's. The ad option is fast becoming impossible to source for those switching from a whip or whose board has stuffed itself.

Cheers
Jim (9323 ans 9350 in the Cruiser)

why would anyone bother with that old dog of a 8558? The 9350 works faster and better, and doesn't need an AD board.
I suppose if you had four of them, you could always make a nice garden table.;-)

I'll have to agree with you Jim. My Jeep Wrangler mounted 8528 & 8558 and I are just about to complete 100 DX countries - mobile operation.. I think one of my best contacts was working an Air Vanuatu pilot running the ham bands at 34,000ft over Noumea on 21MHz from a McDonalds parking lot in Canberra.

Can't beat that 8558 antenna with a stick... ;-)

Cheers,

Alex - VK1AC/2

Hello
Not so out of scoop in fact...
I'm trying to find photo of Roadtrain running across Northern Territory! (As most of them got Codan radio with antenna on the Bulbar its like to ask photo of the antenna :-))

So my question: is anyone of you having the possibility to connect me with a roadtrain operator or having photos about this subject?

I will be very interested!!! As behalf of my radioamateur activity I'm also an owner of a website about trucks www.toprun.ch

Thank you very much for any feedback

have a nice weekend

Yes Jim, I have hadf this problem a couple of times with both newly installed 9323's and ones that have bashed around the Gulf for 60,000 klm's.
A master reset (Disconnect the power at the power connector and go and have lunch!) seems to work most of the time. Seems to be a problem in the control head, mainly aboard sets with Firmware prior to v4.31 seem to be more prone, not all the time though! But ste will still be locked on if you
only disconnect the control head. Not supposed to do this with power to the set, but when trouble shooting the problem, it was one of the things done to narrow down the problem. Could be related to the temperature sensor needing to be installed in the control head with the v4.31 firmware update.
After resetting we haven't noticed those particular sets doing it again or very often. It generally happens when the vehicle is left in the hot sun with the radio
left on but also can happen when a radio is re-installed and turned on for the first time. No answers from our other workshops or from Brisbane.

Regards,
Sam.

Hi Jim

Yep - that's a possibility too, but I don't want to spend the $$ for a whip as well. I've got a Bushcom wire aerial for a backup. For the remote trips I'd rather have the 9350 on the front (in fact I like it there all the time , where I can see it and watch out for things I'm about to hit with it!).

Anyone have a spare control cable? Even a short one would do...

-How long is a short one? I may be able to help you out with the cable minus the connectors, if it's the same cable that's used on the earlier model ATU.

The connector that goes into the control head I puchased from the local computer shop and it was quite cheap.

Dick.

Hi Dick

Thanks for the offer. I can get the serial connector and the cable from DSE or Jaycar - the tricky bit is the connector that plugs into the 9350 aerial base. I'll have to try my local wizard and see if he can conjure one up.

Hi Everyone
I noticed a post about a codan ngt on ebay brand new at the starting bid of $3000 also a used 8525b going so far at $425 [different sellers]My question is is the price for the older set reasonable and can you still get parts.The new one seems to be a good deal,but could one be buying a "pig in a poke" .
Cheers

Hi Barry. Nothing wrong with the older Codans, except Codan don't support them any more with spare parts. So while they can be lots cheaper for the average person they can either be a bargain or an expensive mistake. The rule here is to try and buy from someone you can trust, rather than just anyone.
Cheers
Jim

2406. CODAN 9360 HF TRCVR

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-02-25 09:05:22 UTC
From: Johan Classen
Topic: 2406 Message: 2406

Greetings from South Africa,
My name is Johan and I am a radio amateur with callsign ZS1WC and my qth is Gansbaai, a seaside village 150 km South East of Cape Town.

Sometime ago I aquired a Codan 9360 complete with modem and power supply frm a yactsman who seemed to have lost just abt everything he had. The three pieces are on top of each other in the Codan bracket assy. (PC cables and connectors also attached)
I thought it was going to be very easy to get the radio to work on amateur bands untill I realised that my one brain cell was just not good enough as this was not the everyday ham radio as used by hams or black box operators.

With the help of Codan and especially John Jacobs in the UK i managed to get hold of the CD for Codan discontinued items and on the CD the Ref and User manuals for the 9360.
BUT..it seems that to get this radio to go into Channel Mode I need to solder or "short" the "A" link on the Micro/Audio board. Where is this board fitted on the radio?

Refering agn to my one brain cell, can someone pse tell me where this board is situated? ie do I open the bottom section of the radio to find this board? The top plate removes by removing 2 screws but the PC board on top has a different number.
I am sure you have gathered by now that I am scared to open anything just in case I reset this radio for ever and ever and this wld mean that the only happy guy wld be the yachtsman who sold this rig to me and since disappeared into the 7 seas.
This radio is in perfect condition. 9 channels appear after switching on but I cant get this radio into Channel mode.

Any help will be appreciated..I believe there is an agent who knows the new Codan equipment but have no knowledge on the 9360.

Guys if I am wasting yr time then i am sorry, but I really wld like to see if this radio can hold its own amongst other ham radios like Kenwood es Icom etc and therefore wld appreciate any suggestions and help.

Amateur greetings

Johan Classen ZS1WC

2407. Amateur Radio options

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-02-28 23:10:49 UTC
From: born2roam63
Topic: 2407 Message: 2407

Hi All,
Just a couple of quick questions (I have been through the archives but couldn't find this info if it is there), Which of the codan radios with a remote head option (I think that the NGTs and 8528 can, are there others)can be set up to work on the Amateur radio freqs with some form of VFO option (not having to put each freq in individually) and is there a difference in the 9350 tuners, eg. an early or late variant and how do you tell them apart if there is a difference.

I am after something with some form of remote head as they don't have as much room in the later model 4X4s. Any info greatly appreciated.

Phil

Phil
the 8528 had an amateur option available. see
http://ozradio.wireless.org.au/txe.htm

http://ozradio.wireless.org.au/ngt.htm has info on the ngt amateur
option
the 9350s are all the same, apart from a minor mechanical change to the
coupling between the stepper motor and worm drive. The letter in the
serial number Axxxx etc is the telltale. A is early model. I dont know
when the change was implemented

Topic: 2407 Message: 2409

Phil,

As Ben quite correctly points out, the 8528 was the only set that supported an amateur radio option. It basically will allow free tuning transmit within the amateur bands, so is probably the best option...although there has been some recent talk of an amateur option for the newer NGT's, but I am not familiar with these sets, nor how the option works. All Codans since the 7727C's have the remote head option.

I have a 9323 and have found a way to make the set transmit from the free tuning receiver as well, but it will not show you the exact frequency you are on once tuned up (though you will know from the free tuning). I have tried it with an amateur friend (legally of course) and it works well. I have seen the same feature on only two 9323's though I haven't tested many. The details were passed on to Ben and are on his website under the 9323 section. It would be interesting to see whether this works on all versions of the firmware....??

I have both types of sets and would say that for sheer convenience and mainly amateur use, go for the 8528 with option A, but if your use is primarily VKS 737/Radtel/Bushphone etc, the 9323 would be a better choice...just my opinion.

Not too sure of your question about the antennas, but the 8558 was a good antenna, but took a little longer to tune than the newer 9350. I am fairly certain that the serial number on the 9350 will let you know how early or late a model it is....'A' series is the earliest...then the 'B' Series and so on. 8558 antenna are going for between $200 and $350 ish on eBay, whilst a good 9350 will fetch around the $600 or maybe a tad less. There are a couple on there at the moment. The 9350 is worth the extra $$.

Hope this has been some help. Others may also be able to chip in with their experiences..

Cheers,

Mark

I just acquired a Terlin Outbacker Survivor 27 Antenna at the Central Coast Field day (for one tenth of its new cost !)

Does anyone have any info on which frequency each tap is for. Five are marked for VKS-737, but most are just marked 1 to 27.

There is no info on the Outbacker website - it hasn't been updated since Feb 2001.

Mike

2414. 9350 AUTO TUNE

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-02-29 23:02:19 UTC
From: Ian
Topic: 2414 Message: 2414

Last night I went for a drive to KFC, I have a ICOM 706 connected to a 9350 on my 4wd. I turned the IC706 on and tuned up on 27.355 LSB, I could hear many stations chatting away, and one station I know is about 35-40 km away. when I got to KFC I pulled up to remove my whip antenna from the back of my 4wd, and my whip was gone (later found it on the back seat, the wife had removed it to go shopping) I am wondering why I was able to RX so well? (I did not TX)

cheers Ian

2415. Re: [codan_outback_radio] 9350 AUTO TUNE

Yahoo group: codan_outback_radio (1997 — 2004)

From: Malcolm at "On- Track 4WD" in Greymouth
Topic: 2414 Message: 2415

I have noticed that, I think the whip adds little to the coil in the antenna. Probably would have objected if you had tried to TX though. Would have been well out of tune :-(((
On my one I often switch around the channels and listen without retuning the antenna. Wind the volume up a bit is about all.

If you tuned the antenna without the whip it would have tuned to a different place than it would if the whip was attached. No doubt you could transmit but I suspect that off the spring the distance would probably be not all that far :-))

Without the whip, the base becomes a continuously loaded antenna rather than a centre loaded antenna. The whip lengthens the aerial so it it can tune to the lower frquencies.

At the higher frequencies you will have no trouble getting the antenna to tune - but it will be terribly inefficient being so short and at high power you may have arcing problems, depending on teh internal construction

Subject: [codan_outback_radio] 9350 AUTO TUNE

Last night I went for a drive to KFC, I have a ICOM 706 connected to
a 9350 on my 4wd. I turned the IC706 on and tuned up on 27.355 LSB,
I could hear many stations chatting away, and one station I know is
about 35-40 km away. when I got to KFC I pulled up to remove my whip
antenna from the back of my 4wd, and my whip was gone (later found
it on the back seat, the wife had removed it to go shopping) I am
wondering why I was able to RX so well? (I did not TX)

cheers Ian

2420. 8558 Autotune

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-03-01 02:15:05 UTC
From: Paul
Topic: 2420 Message: 2420

Hi all,

I picked up an 8558 to replace my 8555 auto tune on the weekend.

Does anyone know what the preifix on the autotune serial numbers meant- ie was there any differences to production?? I have an A**** serial number on my antenna.

Also, does anyone have information on where the control plug may be sourced from?

Thanks

Paul

The later D series were a bit more reliable. Connectors are not cheap, try RS components on the web or Farnell. Depending on where you are, you might try Holman electronics in perth 0894466544

Cheers

Hi Jim,
thanks for the reply, I was just looking in the RS catolgue and saw them before your email arrived, would you happen to know what "type"? At the prices listed I would hate to order the wrong one.

I have a feeling it is cheaper to buy the genuine control cable through Codan than to source the connector. I went throught his exercise 3 years ago and it was the case then. I did hear of someone who replaced the connector with a 15 pin D-range type connector. Not sure what was done about water proofing.
FYI. the pinouts of the cable are here http://ozradio.wireless.org.au/8558.htm

Thanks for the information, I will have a closer look at the connecter when I get home. If I need to buy a connector I will post the part number and catologue details. I have dealt with RS when buying other parts and they are very good but lotsa $$$!

I have a copy of the manual for the Codan 8555 antenna - yes the Moonraker monster but it has worked very well when all pros and cons are considered. I dont have a scanner but If there is an interest to put it on file on the CODAN pages or yahoo groups etc I can photocopy it and send it to someone who might be able to scan it. I have found the web sites to be very handy and would be happy to contribute where possible.

>
> I have a copy of the manual for the Codan 8555 antenna - yes the Moonraker monster but it has worked very well when all pros and cons are considered. I dont have a scanner but If there is an interest to put it on file on the CODAN pages or yahoo groups etc I can photocopy it and send it to someone who might be able to scan it. I have found the web sites to be very handy and would be happy to contribute where possible.

From: John Jacobs
Topic: 2407 Message: 2432

Phil,

Both the NGT and the 9323 can have 'Amateur' mode, but it isn't fitted in the radio as standard. Its one of the options for which you need to get a special code number. You could try contacting Codan and blagging it out of them. You'll need to have the ESN, that's the long hex number in the radio.

Regarding the 9350, the gospel on these versions is like this:
A - original version. Silicone rubber coupling between stepper motor and worm drive. Couplings fail after a time due to grease softening the silicone.
B - Black plastic flexi-coupling. This was shrot lived version as the coupling was brittle.
C - New style silicone coupling reinforced with spring clips. The silicone grease which used to attack the A series was replaced with a graphite coating on the leadscrew.
D - Contact spring rivetted to the tuning slug at one end.

Hope this helps when looking at antennas on Ebay

Rgds

John

born2roam63 <lcruiser@...> wrote:
Hi All,
Just a couple of quick questions (I have been through the archives but couldn't find this info if it is there), Which of the codan radios with a remote head option (I think that the NGTs and 8528 can, are there others)can be set up to work on the Amateur radio freqs with some form of VFO option (not having to put each freq in individually) and is there a difference in the 9350 tuners, eg. an early or late variant and how do you tell them apart if there is a difference.

I am after something with some form of remote head as they don't have as much room in the later model 4X4s. Any info greatly appreciated.

Phil

Hi Ben,

I have photocopied the 8555 (8550 series automatic tuning antenna sytem) handbook which has all information/diagrams and parts list. If you would email me off list with a postal address I will send later this week, I will take a picture of the antenna when I can borrow a decent camera.

Regards

Paul

Hi all,

I seem to have an intermittent TX fault at present on my 8525B, It has been slowly gettin worse (over 6 months occasionally and the hot weather seems to have made it worse, ie to the point of no TX,)

I have carefully checked all inter board connections etc and the rig was OK for a day or so then started to play up again, I am going to have a look at it this weekend timne permitting and before I start checking it out I thought I might check to see if anyone else has had similar problems with the 85 series rig? It has also given me problems with antenna tuning as the antenna tune sequence see s no RF and just uT's /beep beep./ Sometimes it has done this midway through voice TX but the Antenna VSWR appears to be OK and I have tried an autotune and a tapped whip with the same result

I also noticed that TX indicator is flickering.. voice TX audio reports are poor copy or no copy.

Any ideas..??
Thanks

Paul

Hi Paul,
Have you put a power meter on the lead between the transmitter and the antenna then pushed tune to see if it is transmitting 100 watts when the set is faulty??? Sounds to me like you may have a faulty PA transistor. If you are not getting output power from the PA stage then your antenna of course would not be able to tune itself. Having one of the two PA transistor faulty would still cause the TX light to flicker but it wouldn't be as bright as normal. A intermittently faulty transistor would be more sensitive to be faulty more often as the weather heats up. Sometimes, when the transistor is faulting you can spray some "freeze" on it and it will start working again because this causes the junction inside of it to reconnect while it is cool. If one is faulty you will need to replace both with a matched pair.
I would suspect that if you put your meter on "power" and transmit continuously you will see the power drop away as the transmitter heats up if a PA transistor is faulty..

Paul, it is normal for the TX indicator to flicker during speech. The louder you talk, the brighter the light will be. I guess what you are saying is the light is not as bright as usual? firstly I would check the PA internal fuse link near the incoming DC cable, then the next bet is the PA transistors. Replace them as a pair, they are matched.

Thanks Malcom,.

i had a quick look at the block diagram last night and it as it is only TX fault and RX Ok it is pretty much isolated down to the PA board or the TX/RX relay interface cable on the motherboard to PA. I had also noticed that when I mounted the radio on its side and it wouldnet work but on laying flat it worked??

I will check all connections/dry joint etc first. I have a little freezing spray left and a few matched pairs of MRF 455's and a test set... now I just need some time on the weekend. (fingers crossed)

Thanks for your help..

BTW ..... Ben I have posted the copy of the 8550 series booklet this morning. should get it next week.

Paul, in case you're not aware, the earlier Khaki coloured board pin connectors (not sure of correct term here :) weren't the best. Later series had the much more reliable white ones. This may or may not be relevant to your problem but it doesn't hurt to know.
Cheers
Jim

2444. Re: [codan_outback_radio] (unknown)

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-03-05 02:03:04 UTC
From: Paul
Topic: 1051 Message: 2444

This is closer to what I originally thought six months ago, I have pulled the boards apart and cleaned them before but the problem prevailed over time,
I may have more that one problem too.

The interconnecting pins are on a redish colour mounts etc. I have considered tinning them but do not want to over stretch the contacts either.

At one point both the emergency tone and Selcall tones would not work, aftert removing the IF/RF boards and plugging them back in all was OK.

I will be looking at these before looking for crook PA etc.

Thanks for help

Ben Hobson <hobbo@...> wrote:
Jim
good memory forgot about them.Paul unlpug all the boards and give the contacts a squirt with contact cleaner
ben

What a silly boy I am. There is a Codan TSB that covers this
situation nicely. If anyone else has this problem I can (now) help.

Cheers
Jim

Jim,

Forgive my inadequacy, but what is a "Codan TSB" ??Technical
Service Bulletin?? Could you explain the 'fix'?

Glad you worked it out, though...

Cheers,

Mark

Yes the TSB is a technical service bulletin. (Codan just call them a Service Bulliten)
Like most manufacturers Codan send them to their dealers to support the maintainance of their equipment. Sometimes if you buy a manual for a radio you may be lucky enough to find some old tsb's inside.
If you're REALLY lucky you might find an ex Codan dealer on his way to the dump. This scenario is highly unlikely but not impossible. (Be sure to mug him before the recycling people tell you to nick off :))
Cheers
Jim

I think I might have asked a question quite a while ago if anybody had any info on Wagners - I was fitting a pic-based two-tone alarm to mine, and was after a circuit diagram. Unfortunately I didn't get any response to my question, so I had to make it up as I went along!

Cheers,

Ian

2451. Re: [codan_outback_radio] 8558 Autotune

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-03-07 12:54:34 UTC
From: Paul
Topic: 2420 Message: 2451

Hi All,

Yes I know, another quick question from me again,all help appreciated.

I cleaned all the interconnecting pins/sockets on the RF boards again and the TX seems OK after recent problems. I fitted my 8558 this weekend and it seems to work Ok, but I have found that sometimes it seems to sweep past the tune point on certain channels, (mainly 7Mhz)- Tunes Ok then later it wont. I do notice the peak in output power on the led indicator but it seems to miss this point (Has anyone experienced this before??)

The vehicle is a 60 series landcruiser and the antenna is mounted on the bullbar which is grounded to the body, I have also run a short ground from the hex bolt on the base plate to the vehicle body and the whip is a 6ft braided whip. I have noticed the "impedance" modification for some 80 series and similar vehicles, does this sound like similar syptoms.?? Is there any further information regarding the impedance mod of a technical nature..like a TSB .ie why??

Thanks again

Paul

Hi Jim,

No I havent but it appears to tune most of the time, and if one transistor was stuffed I would of thought a 4 pole stepper motor would only travel 270 degrees in either diirection, and the antenna seems to sweep to both extremes .

Thanks for the quick response, you must be as bad as me on sleep deprivation... maybe it is a radio thingie.

Good night

paul

Yes I know, another quick question from me again,all help appreciated.

I cleaned all the interconnecting pins/sockets on the RF boards again and the TX seems OK after recent problems. I fitted my 8558 this weekend and it seems to work Ok, but I have found that sometimes it seems to sweep past the tune point on certain channels, (mainly 7Mhz)- Tunes Ok then later it wont. I do notice the peak in output power on the led indicator but it seems to miss this point (Has anyone experienced this before??)

The vehicle is a 60 series landcruiser and the antenna is mounted on the bullbar which is grounded to the body, I have also run a short ground from the hex bolt on the base plate to the vehicle body and the whip is a 6ft braided whip. I have noticed the "impedance" modification for some 80 series and similar vehicles, does this sound like similar syptoms.?? Is there any further information regarding the impedance mod of a technical nature..like a TSB .ie why??

Thanks again

Paul

Hi Malcom,

No I seem to have solved the txcvr problem for now, it was interconnecting pins/sockets on the RF board. I picked up a 8558 last weekend and fitted it yesterday, when I have tested it out it appears to tune all frequencies ok but I have noticed that every so often it seems to not tune some frequencies (mainly 7MHz). If you watch the TX indicator you can see the output power peak as you would expect but the antenna keeps on tuning and times out. I had noticed the X1/X2/X3 jumper impedance modification (and I dont know if it has been performed on my antenna) for 80 series vehicles etc and since I have a similar vehicle was wondering what "tuning difficulties" warranted perfoming this mod or if the mod was already performed would it cause tuning errors. For all intents the antenna seems to perform just fine apart from not tuning certian channels at certian times. I have tried different locations in case of near field influences etc.

Any help is appreciated.

Paul

Paul, I've seen this happen when the ad board drivers are on the way out.
Give it a tune and put your finger CAREFULLY on each of those ad board
driver transistor tabs. If crook one will be so hot that it may try and burn
the finger off.
Sleep ? What's that ? :))
Cheers

paul
the old 7mhz problem :))
perform the mod as per my page, it may solve the problem. this kind of fault is what it was designed for.
unfortunately most vehicles have a freq that the antenna wont tune. i suggest the ad board is fine as it tunes on other freqs. other desperate measures include trying with/without spring, another whip if you can or relocating the antenna.
when i had the hf on my falcon (yes!) it would not tune on 7mhz unless you tuned down to it. i.e tune a 10mhz chan first and then tune the 7mhz. weird but thats life. i have a mate who did a trip around oz a while back and he had to unhook his trailer to tune 10mhz!!!

2464. Re: [codan_outback_radio] impedence mod..

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-03-08 01:33:15 UTC
From: Paul
Topic: 2460 Message: 2464

Thanks Ben,

occasionally I had to do this with the 8555 moonraker but not very often, I also noticed the 8555 tunes faster than the 8558 but I suppose it is only matching 2-12Mhz so maybe it does not have as much of a range of inductance" to tune through or the gearing is not as low as the later 8558,

I will try the impedance mod when I have time later this week.

I did try the tune near freq. method but I was surprised as the 8558 just seems to miss the tune point (eg 8 or 10Mhz then down to 7Mhz) - or even to the point when I shift 5-10Khz -it just starts whirring away and misses the original tune point. I would of expected a quick retune like the 8555

As for the trailer tuning method, seems to be adverse to the convienance of an auto tune :))-
I wonder what the XYL said avery time he wanted go to 10MHz, and I thought having a tapped whip caused enough intermarital grief every time I wanted to change bands. (usually resulted in a rather loud sigh and that look :((

By the way, has anyone tried to tune a random length of wire from the 8558, is there a maximum radiator length (obviously related to how much "L" is loaded by the tuner).

Thanks to everyone for there help.

2466. Re: [codan_outback_radio] impedence mod..

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-03-08 01:59:35 UTC
From: Jim
Topic: 2460 Message: 2466

I'm actually a big fan of whip aerials. Few 4wd trips enable me to change channels easily and safely while on the move. Most of the time I sit on an emergency channel. I tend to travel solo and long distances at a time. Changing the whip tap gives me an excuse to stop. But when its wet and muddy, or that wind is blowing the sand about, you cant beat an autotune. I guess I got one round about the time I discovered air con beat a trip (or 3) outside :))
Cheers

By the way, has anyone tried to tune a random length of wire from the 8558, is there a maximum radiator length (obviously related to how much "L" is loaded by the tuner).

Thanks to everyone for there help.

Hobson <hobbo@...> wrote:

the old 7mhz problem :))
perform the mod as per my page, it may solve the problem. this kind of fault is what it was designed for.
unfortunately most vehicles have a freq that the antenna wont tune. i suggest the ad board is fine as it tunes on other freqs. other desperate measures include trying with/without spring, another whip if you can or relocating the antenna.

when i had the hf on my falcon (yes!) it would not tune on 7mhz unless you tuned down to it. i.e tune a 10mhz chan first and then tune the 7mhz. weird but thats life. i have a mate who did a trip around oz a while back and he had to unhook his trailer to tune 10mhz!!!

Folks, noticed this on ebay
http://cgi.ebay.com.au/ws/eBayISAPI.dll?ViewItem&item=3083209377
These brackets were well made. I know Telstra and some QLD police vehicles
used them.

Cheers
Jim

Hi Paul,
I see by your later email that you are having probs on other frequencies as well and you are getting lots of advise so ill leave it to others. I have some ideas why its not tuning at different frequencies because mine did that as well. If you cant fix it with what everyone else suggests give me another call.

Subject: Re: [codan_outback_radio] 8558 Autotune

Hi All,

Yes I know, another quick question from me again,all help appreciated.

I cleaned all the interconnecting pins/sockets on the RF boards again and the TX seems OK after recent problems. I fitted my 8558 this weekend and it
seems to work Ok, but I have found that sometimes it seems to sweep past the
tune point on certain channels, (mainly 7Mhz)- Tunes Ok then later it wont.
I do notice the peak in output power on the led indicator but it seems to miss this point (Has anyone experienced this before??)

The vehicle is a 60 series landcruiser and the antenna is mounted on the bullbar which is grounded to the body, I have also run a short ground from the hex bolt on the base plate to the vehicle body and the whip is a 6ft braided whip. I have noticed the "impedance" modification for some 80 series
and similar vehicles, does this sound like similar syptoms.?? Is there any further information regarding the impedance mod of a technical nature..like
a TSB .ie why??

Thanks again

Paul

I seem to only have the problems around 7MHz at this stage. I will try a few things like different antennas on the ATU and some mobile tests before checking out the impedance mod, Thanks for your help

I think I have enough to go with for know, if this doesnt work I'll try another post...or if anyone has another 2 cents worth I happy to listen.

Regards

Paul

2475. 9323 power usage

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-03-08 21:00:08 UTC
From: Barry
Topic: 2475 Message: 2475

Can anyone tell me how much power the 9323 draws.
Last weekend I left the unit running in scan mode for about 8 hours (unintentionally) along with an Engel fridge and found later that night that my 55w aux. battery was nearly dead. I know the Engel can run for a couple of days on the battery so can only put it down to either the radio or a sick battery.
Cheers,
Barry.

Paul
TXE is part of the eprom image. It was not widely available due to ACA regs. only a select few govt departments had access to it. What it allows is NOT free tuning across the entire range, but creation of P channels with TX & RX freqs. normal radios you can only create RX only P channels. There is a way around this however (which I wont post here) and TX E becomes a bit of a blue duck.
cheers
ben

Topic: 2486 Message: 2487

Thats a good question. I don't have the information but perhaps we could use the following ideas to arrive at a ballpark figure (and I stand to be corrected here.) The 7113 will happily run a 6801 at 100 watts output. (or the marine version at 110w) So for 100 out we'd have to have an input of say 240w.(I've fudged to make it easy). At 12v thats 20 amps. Now the output voltage is closer to 13.8 so lets deduct a bit. Also note that A3J isnt 100% duty. But these supplies were built to last and work under severe conditions without hassles, so we can add a bit.
I've come up with a figure of 20-25A peak and say 15a continuous.
Hows my guessing ?

Cheers

2490. Codan 8528

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-03-13 01:09:18 UTC
From: Tony
Topic: 12 Message: 2490

For those looking for a 8528, on Ebay is a CODAN 8525B 100 Watt 99 Channel HF Transceiver. Local Control version.
Serial Number # B7024
This is the sought after newer "B" model.
Included is Mounting Cradle, Microphone and programming software. ie the unit is complete.

This has been my base uint, and is fitted with a one-off eprom enabling transmission on 160 and 12 Meter Ham bands. ie a software modification allows Tx below 2 and above 24 Mhz. Possibly this is the only 8525B so equiped. See attached channel listing.

http://cgi.ebay.com.au/ws/eBayISAPI.dll?ViewItem&item=3083012767&category=3308

Cheers
Tony Balm
PS I have no affiliation with the seller - just saw the add & passing the info on to those who may not have seen it.

I'm a beginner / lurker,
so is this good value at $500 - $600 (need to get aerial etc. and who knows what the condition)..

Brad, oh no not a lurker ! LOL Yes the 25b's are around that price. Make sure it has selcall and if possible an AD board (to run an autotune later). Depends on the condition of course. I've paid 350-600 for them.
The 25 b can be turned into a 28 if you want to shell out another 250-300 and if you can find a head (rocking horse do). Mind you it then becomes a far more versatile machine.

Cheers
Jim

Hi All,

In reference to all those replies I had last week regarding my 8558 antenna with Tuning dificulties on 7MHz.

I had a chance today to change the X1-X2-X3 link today and after a few brief tests it appears to be operating much better, It will tune those 7MHz freqs that were "iffy" before and it seems that the tune times appears to be quicker.

Thanks to all for help with my post about 8558.

Paul

Date: 2004-03-14 12:52:29 UTC
From: ntmining
Topic: 2496 Message: 2496

gday

I have a pristine 7924 with 10 chnnels fitted (all ARMY DEFENSE ONES). To get this rechannelled, to say 3 x VMS or VKS, anyone an idea of what it would cost labour wise? crystals I have had quoted already.

I assume that the radio is similar to the 6924. Difference I think is the level of environmental protection inside.

In other words, is it a bugger to do or straightforward?

THANKS

SEAN

assuming the coils match the freqs ranges, the cost for the crystals
around $25-30 each and allowing 1 hour for tuning the cost would be
in the $200-$300 range using a technician. (my cost to a client for
same cost and time)

If your handy and got access to test equipment and circuits the cost
would be just the crystals

Regards

Frank

As Frank says, its a matter of how well you know your way around them. Much of the early stuff had easily fractured/broken coil formers and slugs. You may have to change a tap or two on the output. Basically it can be as easy or as difficult as your expertise and radio allow.
I've never seen a 7924. I didn't know they existed. Do you have access to a digi cam ? I'd love to add a pix and perhaps a few comments to my 6924 webpage.

Cheers

2499. 8528 option TXE

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-03-15 05:31:14 UTC
From: Ben Hobson
Topic: 2484 Message: 2499

Let me clarify a few things in regards to 8528's and various options.

There is no option available that allows general coverage free tuning across the band.
The closest thing is OPTION A (amateur) that allows free tuning of TX ONLY WITHIN AMATEUR BANDS.

OPTION TX-E was available to a select few, mainly government authorities that allows addition of P channels with both TX & RX frequencies. 99 P channels maximum can be added.

The usual, run of the mill 8528's had option TX-D (including most with amateur options) which does not allow addition of P channels with TX & RX freqs. You can only add RX ONLY P channels, again up to a maximum of 99.

There is a method that allows you to add TX & RX P channels to a TX-D equipped 8528. Details are on my site, but they will not be posted here. Hence my statement that TX-E is a blue duck.....

The page 'Options A, TXE, TXD - their use and how they work' lists the amateur band plan details.

Most often the Amateur option included the Aus 27mhz CB plan as well, obviously only LSB/USB.

Finally, any requests for TX-E to be supplied will be ignored, and if posted to this list will result in banning of the person responsible. ACA regulations forbid equipment to have general TX coverage. I also will not provide details on how to make 8528s TX below 2Mhz & above 24Mhz

Thanks jim/frank.

Yes i havent seen these before either,looks as if they were in storage there entire life as they are brand new. Will post a pic, but like 6924, inbuilt tuner/antennae switch, tuning done via lamp not meter, am/usb/lsb and canon plugs for all connectors, and telephone handset and morse key. comes in bag with collapsible antenae. Power output seems to be around 25W. Looks as if you can soak the entire insides in a bucket of water as heavy duty circuit board laquer and protection, although as an army set dont think it would take a bullett, but who knows..

Channels are all TOO scary to TX on, looking at their assignments on ACA websitem, so better rejig it.

Thanks

SEAN

2501. Re: [codan_outback_radio] 9103

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-03-15 20:44:50 UTC
From: Malcolm at "On- Track 4WD" in Greymouth
Topic: 2501 Message: 2501

Hi Group,
Can anyone tell me the operating details for a 9103 "Base" antenna auto tuner??? i.e.. does it operate like the mobile auto tunes, scan facilities etc?????

Regards,

Malcolm Langley

Subject: [codan_outback_radio] 8528 option TXE

Let me clarify a few things in regards to 8528's and various options.

There is no option available that allows general coverage free tuning across the band.
The closest thing is OPTION A (amateur) that allows free tuning of TX ONLY WITHIN AMATEUR BANDS.

OPTION TX-E was available to a select few, mainly government authorities that allows addition of P channels with both TX & RX frequencies. 99 P channels maximum can be added.

The usual, run of the mill 8528's had option TX-D (including most with amateur options) which does not allow addition of P channels with TX & RX freqs. You can only add RX ONLY P channels, again up to a maximum of 99.

There is a method that allows you to add TX & RX P channels to a TX-D equipped 8528. Details are on my site, but they will not be posted here. Hence my statement that TX-E is a blue duck.....

The page 'Options A, TXE, TXD - their use and how they work' lists the amateur band plan details.

Most often the Amateur option included the Aus 27mhz CB plan as well, obviously only LSB/USB.

Finally, any requests for TX-E to be supplied will be ignored, and if posted to this list will result in banning of the person responsible. ACA regulations forbid equipment to have general TX coverage. I also will not provide details on how to make 8528s TX below 2Mhz & above 24Mhz

Subject: [codan_outback_radio] Re: 7924 military version

Thanks jim/frank.

Yes i havent seen these before either,looks as if they were in storage there entire life as they are brand new. Will post a pic, but like 6924, inbuilt tuner/antennae switch, tuning done via lamp not meter, am/usb/lsb and canon plugs for all connectors, and telephone handset and morse key. comes in bag with collapsible antenae. Power output seems to be around 25W. Looks as if you can soak the entire insides in a bucket of water as heavy duty circuit board laquer and protection, although as an army set dont think it would take a bullett, but who knows..

Channels are all TOO scary to TX on, looking at their assignments on ACA websitem, so better rejig it.

Thanks

SEAN

Hi all,

a quick question (aren't they always) ??
the link settings in the 8528 control head... do you need to set it
to 'E'xtended control when there is only a remote head in use??

Regards

Paul

Thanks Jim,

I should be getting my new remote head tommorrow and it will be mounted in my o/head console so I want to make sure that I dont have to pull the ruddy thing apart to move a link I forgot...

From what I can tell most of the settings are front panel entry after eprom ver 4.1, so I shouldnt need to set the link to program settings???
Also how hard is it to adjust the LCD viewing angle?

Paul

Paul, yep its all done from the front panel. Not sure of what you meant by adjusting the led viewing angle...isnt this a function of the relationship between yout eyes and the leds ?:)))) Pleased to see that you have a new 28 head...I'll bet that cost a packet. I have a 25b here waiting on a cheaper one as soon as pigs can fly.
Cheers

Paul
you are correct in that eprom version after 4.1 you can forget about changing jumpers..
The LCD view angle/contrast is adjusted by inserting a small screwdriver into the hole on the underside of the head. You may have to push aside the foam that sits over the hole.
cheers
Ben

Got the hair fallin out trick with the missus at present. But she says that unlike mine, hers will grow back. Trouble is it could be any colour or grey, straight or curly. I told her for better or worse were the words, not for better or curley blonde. (sheez a brunette) Only good point she rekkons is she wont have to shave her legs for a while.
No wonder when she went to the specialist (in pain from the arm op still...infection) the doc said she was lookin good.....she still had hair :))))))
I offered to shave her head and she said she didnt trust me , mazing how she trusts me with the housework....women :))

Got the hair fallin out trick with the missus at present. But she says that unlike mine, hers will grow back. Trouble is it could be any colour or grey, straight or curly. I told her for better or worse were the words, not for better or curley blonde. (sheez a brunette)
Only good point she rekkons is she wont have to shave her legs for a while.
No wonder when she went to the specialist (in pain from the arm op still...infection) the doc said she was lookin good.....she still had hair :))))))
I offered to shave her head and she said she didnt trust me , mazing how she trusts me with the housework....women :))

Not sure what model, but there is a codan tuner that works off RF. Mate used it on his kenwood with a long wire antenna.

2513. Re: [codan_outback_radio] Re: 7924 military version

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-03-18 11:07:42 UTC
From: Sam Point
Topic: 2496 Message: 2513

Hello all,
Well I can remember a bit about the 7924. It was around in 1985 when I was testing modifications to the Moonraker Auto-Tune antenna for the 8525 (Top whip assembly and base vibration isolation unit (Neoprene rubber "Spring")). I actually saw one at the Codan office at Chatswood in Northern Sydney. It had been developed of the 6924 for Para-Military use (Military and Police force use). Norforce I think had quite a few at one stage as it was similar in operation to the 6924's then in operation in Northern Ouback and coastal Australia. I remember seeing one in an ARES sigs store marked as "Emergency Net Radio", emergency for what the WO2 wouldn't say at the time but it could also be used for "Civil Emergency Operations" (CIVOP) ie cyclones etc. as all it needed was a car battery. Some went
to Fiji and New Guinea from memory and contacts.
I also used to have a few pamphlets for it as well but I've managed to loose them on our Northwards move. Basically it was a mil spec'd 6924 mk 2. With NATO
standard audio and power connectors. The handsets for it originally came from AWA who made the Australian Defence Force F1 HF tranceiver family for Australia.
1 - 12 Mhz, tuner inbuilt, portable whip antenna as well, it ran off 28volt NiCad batteries that slid into the radio and charged on a large charger.

Regards,
Sam

2515. Re: [codan_outback_radio] 9103

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-03-18 12:32:15 UTC
From: Sam Point
Topic: 2501 Message: 2515

We have some units in their boxes in the store at work (For the Water Rats of course:-)), so I'll check and see what model they are 9103 seems right though.. CODAN did use a "Badge Engineered" unit from SGC in the USA.
It was in a black moulded 2 piece box. Info is available frm www.sgcworld.com and the manual is at this link:
http://www.sgcworld.com/publications/pubs.htm

Model SG-230 SmartunerTM automatic microprocessor antenna coupler.
Coupler can be used within its' power rating with any HF Transceiver in range of 1.6-30 MHz.
Designed for marine, portable and fixed base applications.
For antenna types: 23 ft marine whip for 1.6 to 30 MHz and with 9 ft. minimum antenna for 3-30 MHz operation

Number of memory channels: 170
Frequency range: 1.6-30 MHz
Power rating: 200 watts PEP maximum: 12VDC. operation
VSWR (Typical): < 2:1
Tune power: 3 watts nominal
Weight: 8 Lbs.
Dimensions: 16Dx12Wx3H
Supplied with 9 ft. cable for coaxial and DC power

Regards,
Sam

2516. Re: [codan_outback_radio] Re: 7924 military version

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-03-18 13:01:54 UTC
From: Sam Point
Topic: 2496 Message: 2516

What was used up until the latest "Raven" type of digitaly capable HF radios were introduced. Last used in the Army reserve for manpack portable and
forward portable HF comms. USB, LSB, CW and FSK TTY using external terminal, 1 - 12 Mhz in 1 khz units.
The "F1 (Aust)" HF Tranceiver gave about 30 w PEP on battery but could be placed on an "Expander unit" for mobile or base use running from external 24v or 240 volt AC power with a 100w wideband linear and larger antenna tuner for the higher power. I used them in the late 80's eary 90's. I still have 2 of the portable whip tuners for an F1, purchased through the DAS Auctions at St Mary's in Sydney, I have one version as the tuners came in 2 types. One used a bayonet pin and screw ferrule at the base of a spring below the tuning knob to mount directly to the top control panel of the radio (This is the type I have, I carried them for use with an old Wagner P5 HF emergency set I used to carry on trips (3 channels with 5 W PEP output and run off 2 6 volt lantern batteries that fitted inside. I also used them on a 25 w Wagner for testing sometimes on Flood boats.) I have a mount made up with an original socket sourced from AWA at North Ryde who made the units.) and the other clamped to the side of the F1 Tranceiver and had the spring mounted on the top of the tuner with a socket for the 12' whip, this I think was the later type as the earlier version didn't look as if it could take too much torsion if you ran through the scrub with the whip fitted!

I have seen them for sale in Disposal stores in Sydney, packed in wooden transit boxes C/W dipole and longwire antenna's, battery charger, 2 batteries, handset, headset "Lightweight monaural (Single Earpiece)" setup cards and operating manual, all for the princely sum of $600.00! Not to sure how good the Ni Cad batteries would be though!

Sam, what a memory ! Thanks for that info, I worked for AWA many years ago in their Broadcast division. They made some good stuff. Hadn't heard of the F1, but know of the Raven stuff. The F1 sounds interesting, kinda like an advanced Codan 6924. Or should that be 7924 :)) Sheesh, the variants of that radio! Wouldnt be surprised if there was a mk1 and 2 etc there also. Probably came with twin overhead double chromed camshafts as an option. I'd heard somewhere about Codan rebadging some SGC stuff. If the one Malcolm asked about was one of em he should of grabbed it.
Hope that cyclone/tropical low up your way didnt dump too much on the property. You can only use so much ground conductivity without a boat :))
Cheers
Jim

I used them in the late 80's eary 90's. I still have 2 of the portable whip tuners for an F1, purchased through the DAS Auctions at St Mary's in Sydney, I have one version as the tuners came in 2 types. One used a bayonet pin and screw ferrule at the base of a spring below the tuning knob to mount directly to the top control panel of the radio (This is the type I have, I carried them for use with an old Wagner P5 HF emergency set I used to carry on trips (3 channels with 5 W PEP output and run off 2 6 volt lantern batteries that fitted inside. I also used them on a 25 w Wagner for testing sometimes on Flood boats.) I have a mount made up with an original socket sourced from AWA at North Ryde who made the units.) and the other clamped to the side of the F1 Tranceiver and had the spring mounted on the top of the tuner with a socket for the 12' whip, this I think was the later type as the earlier version didn't look as if it could take too much torsion if you ran through the scrub with the whip fitted!

I have seen them for sale in Disposal stores in Sydney, packed in wooden transit boxes C/W dipole and longwire antenna's, battery charger, 2 batteries, handset, headset "Lightweight monaural (Single Earpiece)"

setup cards and operating manual, all for the princely sum of $600.00!
Not to sure how good the Ni Cad batteries would be though!

Sam

Topic: 2501 Message: 2518

The 9103 Codan tuner is basically an SGC unit with some Codan improved software in allowing the Scan line to reset the tuner back to wide open. One RF cable, one power/control cable. It auto-tunes on RF. There's a link inside to set whether it retunes every time or remembers previously used frequencies.

Hope this helps

John

Not sure what model, but there is a codan tuner that works off RF. Mate used it on his kenwood with a long wire antenna.

Jim wrote:

> Malcolm, just had a thought. Does it run from a single cable that connects to the radio ? Or perhaps have a sticker with frequencies on it (pre tuned ?) Maybe some clues on the unit.

2521. Help with Selcall microphone on Codan 8727

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-03-29 12:54:01 UTC
From: fredye50
Topic: 2521 Message: 2521

Can any one assist me by providing me with a guide (or a operating list) for my Selcall microphone on a Codan 8727 please?

The microphone is identical in appearance to the JENAL SC-3 HF SELCALL MICRPHONE (fitted to the 8525?)

For example, I believe that in order to send a selcall I need to press "*" (star) followed by four digits then activate the "Call" switch on the control "head". {After conducting a "test" call with a mate - this didn't seem to work}

There are bound to be other functions available as well?

I have recently acquired the radio and I am keen to be well "acquainted" with its operating procedures prior to venturing in the Outback.

Any members help would be much appreciated, thanks

Terry (Fred)

Mike, somewhere on that site I thought there was some guff on selcalls and beacons. I know their little mag has it in from time to time.
As you know each base has its selcall number where you can reach them in emergencies etc and also a beacon you can try and get revertive tones back from. Just punch in the appropriate numbers and call. The 9323 will remember the last number called on that frequency.
If you expand your question a bit I'm sure someone on the list can provide more info.
Cheers
Jim

Nike,

Not sure what you mean. The manuals sets it out pretty clearly. Also, I think that on the Radtel site there is a page on how to use the various Codans (but not the NGT). Doug Taylor of Lake Macquarie sells laminated 'how to' sheets for about $80. They helped me with the NGT initially,

Hi Sam,
Thanks for the reply. It was me who was looking the 9103 info. There was one for sale in e-bay but I did not bid on it as the info I wanted was a bit late to be able to bid on it.. That's ok though.
Would be a good idea to put a PDF file about it (user manual) on the groups file page if you have the time.

Hi learned peoples

I've got the opportunity to buy one of these for $800. I know the A-model doesn't extend to 400MHz. Any advice about what I should look for before committing to the purchase (It will replace the old 720A).

Hows this price ? and how much could I get for a 9323 minus the 9350 ?

Someone published an interface diag for the Codan 9350 to suit a Yaseu FT-857 recently. Anyone know if a similar circuit exists for the 706 ?

Peter,

I have the 706 Mk IIG and successfully drive a 9350 with it. I assume the
Mk II is the same as far as the auto-tune interface is concerned.

You do not even need a circuit. All you need is a conversion cable which a
Brisbane company sell for about $30. Contact me off-line and I will send
you details,

Peter VK4GPP

2533. 8528 programming help.

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-04-02 06:28:14 UTC
From: Mark
Topic: 2533 Message: 2533

A little help from all you programmers....

Have been trying to reprogram an 8528 eprom. Burner seems to be working OK, but since the first eprom has been removed and refitted, the display shows "queue full' and some gobbledeegook.

Eprom .bin file checked and read with the Codan software and seems to be all OK.

Anyone know what this message means? And particularly how to fix it as the display is stuck on with this message and the set can not be powered down with the front controls...only by removing the power source...

Any help appreciated,

Cheers,

Mark

never seen that before.....
Do you have another blank eprom you could try, or alternatively re-burn the eprom you have with a previous version of your eprom image. If there is the option, try setting your burning software to a longer write pulse.
What happens if you read back the eprom with your burner software, save it as eprom.dat and then try to open it in 651pcfil. Is it recognised as a valid file?

Have you used this burning combination before successfully? A trap sometimes is not not burn the last byte in the eprom image. load/burn 0 to FFFF hex (0 to 65535) which is actually 65536 bytes (10000 hex) .65536 divided by 1024 gives a 64K file. Does the checksum bytes verify OK after the burn?

From: Mark
Topic: 2533 Message: 2535

Ben,

I am new at the eprom burning stuff, but learning as I go.

What I originally did was to do a read of the eprom that I had, so as to create an eprom.dat file to read on the 651pcfil software. This was successful. When I inserted the eprom back into the set, the problems began.

Since then I have tried burning the same image to new eproms and re writing the old with no luck...same message each time, though it seems to verify and be read ok by the 651pcfil.

I have downloaded the 'basic.bin' file from your site, converted it to an eprom.dat file and it is recognised by the 651pcfil program. I will burn an image from this .bin file and see what happens (also slowing the write speed down a little...195uS OK?) then convert it to eprom.dat and see whether the 651pcfil recognises it and get back to you...just waiting for the UV eraser.....will get back to you.

Cheers,

Mark

From: Mark
Topic: 2533 Message: 2536

Ben,

OK Further update.
1. Downloaded your .bin file as previously stated checked OK.
2. Burnt bin file to eprom..all seems fine..verified by software.
3. Read eprom in burner, saved file as eprom.dat and opened by
651pcfil...no error messages. So far so good!
4. Turned power off on power supply. Inserted eprom. Power on to
set and set powers up with message "queue full". No access to front
panel controls and unable to power down the set...

Any further suggestions??

Mark

Mark,

If you have reinserted the original unaltered eprom and got the error message on startup, then I would look for something else that might have happened while removing and replacing the eprom. Look for another chip or a connector not seated correctly.

A couple of hints:
1. Never erase and reprogram your original eprom. Suitable eproms can be found on many old computer motherboards (486) and other computer cards.
2. Always remove the power before changing jumper settings or removing the emprom. I always remove the power before opening the set.

Ken.

Mark
a few possibilities here...
there is another fault with your radio, as someone else suggested
Your eprom burner is damaging the eprom somehow when you read it.
the eprom itself is faulty. They can be damaged by too long in the
eraser sometimes.
Is the voltage settings correct for the eprom. Some 27c512 are 12.5volts
& some are 21 volts. If they are wrong, goodbye eprom... voltages are
usually very clearly marked on the chip.

re the burn speed, the slowest setting you can find, with the highest
number of re-tries is the best. It may take 15 minutes to burn, but is
more likely to be successfull. Its pretty hard to advise particular
settings for you as there are more PC/software/burner combos than stars
in the sky.
What happens if you power up the set with no eprom? Any error message or
just a blank display.

Topic: 2533 Message: 2539

Ben (and Ken),

Thanks for the ongoing help.

I have a pretty fast computer and a Willem eprom programmer with windows-based software. I have programmed several eproms with various bin files created from the 651pcfil software, burnt the images, inserted them into the set, tried to power up with no luck , then removed them and re-read them on the burner and re-converted the files to dat files and they still read perfectly by the 651pcfil software. It seems as though the eproms are fine, but there is something else wrong with the set.

Each time I have removed the eprom, I have always removed power from the set, as I know not to remove/replace eproms with power applied due to the possibility of random writes etc... I would also think that if the voltages were incorrect, the eproms would not be able to be read again on the burner after having been destryed by the higher voltage...would this seem correct?

Re the burn speed, I must say that they burn very quickly...about 8 - 12 seconds is all it is taking.

When the set is powered up with no eprom, I just get a blank screen. I have even spoken to the tech department at Codan in Adelaide and the fellow there suggested that "he has seen this error message before but can't remember what it means...very helpful.

During the week I will try inserting an eprom from a known reliable programming source that has been nowhere near my burner/computer and see what happens. This should show up whether it's my burning system or a fault with something else in the set.

Any further suggestions welcome....

Cheers,

Mark (losing even more hair!!)

Ben,

Just as a matter of interest, can you tell me the functions of the various files in the 651pcfil software 'folder'.

There are xxxx.28 files, xxxx.GL3 files and of course the eprom.dat file. With all the stuffing around are reading/creating files, I have just found that the serial.651 file was not in the correct folder. Is it possible that this file contains important Codan OS data that also get written to the eprom.dat file when one selects 'program eprom'? Could this be the problem?

I will have another go at it later this afternoon and see how things go. I will move all the other files out of the folder and just leave the ones that are supposed to be there and try again.

Will let you know how I go.

Cheers,

Mark

ps What would tWP and tWC be in the burner program...I am assuming t stands for time and WP for write pulse?? WC = ?? write copy???

Mark, not sure about your software but I had to make up a 286 machine that runs at under 10meg, yep 10. That solved my error on burn problem that had plagued me. Also when reading an eprom be sure that you are looking at the read file. 651pcfil looks for an eprom.dat, any eprom.dat for that radio will be read. I suspect that the speed thing may be your problem. DOS programs from the 80's don't seem to like P3's :))))
Anyway we'll see.
Cheers
Jim

Ben (and Ken),

Thanks for the ongoing help.

I have a pretty fast computer and a Willem eprom programmer with windows-based software. I have programmed several eproms with various bin files created from the 651pcfil software, burnt the images, inserted them into the set, tried to power up with no luck , then removed them and re-read them on the burner and re-converted the files to dat files and they still read perfectly by the 651pcfil software. It seems as though the eproms are fine, but there is something else wrong with the set.

Each time I have removed the eprom, I have always removed power from the set, as I know not to remove/replace eproms with power applied due to the possibility of random writes etc... I would also think that if the voltages were incorrect, the eproms would not be able to be read again on the burner after having been destryed by the higher voltage...would this seem correct?

Re the burn speed, I must say that they burn very quickly...about 8 - 12 seconds is all it is taking.

When the set is powered up with no eprom, I just get a blank screen. I have even spoken to the tech department at Codan in Adelaide and the fellow there suggested that "he has seen this error message before but can't remember what it means...very helpful.

During the week I will try inserting an eprom from a known reliable programming source that has been nowhere near my burner/computer and see what happens. This should show up whether it's my burning system or a fault with something else in the set.

Any further suggestions welcome....

Cheers,

Mark (losing even more hair!!)

12 seconds sounds a bit quick for my liking as a burn speed. I have had a similar problem to what you are having with a different radio eprom. I think it will come down to a burn problem in the end. From experience I have found slow = reliable. Having said that I currently use a P4 laptop booted into DOS 6.22 to burn eproms successfully. It required a bit of juggling with the burn parameters to make it work & a codan eprom takes around 5 minutes. It only takes one incorrect bit for the wheels to fall off.....
If your combo is windows based it should work OK on a pentium machine. Try fiddling with parameters to slow it down. There may be even a 'dummy burn' you can enable just to check the burn time. (nothing is written to the chip, it just pretends) Sorry, but you'll have to nut this part out yourself..

the xxx.28 & x.gl3 are created when you edit your eprom file. They are what contains the frequency info & eprom options. They can be used to 'save' an eprom file for later recall, but its messy and confusing.
The serial.fil is just a text file.
All that is required to run the software is 651pcfil.exe in a directory by itself with your eprom.dat. Any other needed files will be created.
The other 651pcXXX.exe programs are for specific (extinct dinosaur brand) eprom programmers, that you could directly add channels from the program.

Ben,

A breakthrough. After returning the serial.651 file to the correct directory, I editied one of my many existing eprom.dat files, fiddled around with the burner a little and had a modicum of success. The eprom, when inserted into the 8528 now seems to work...alomost correctly. The radio powers up and responds to buttons. I can turn off and on etc...the only problem is that the radio is requesting the entry of a pin number???

Any idea what might be going on here?? I don't recall there being any areas in the software that allow the entry of a pin number??

Cheers and still scratching head...but happier now that I'm a little closer (or so it feels).

What about if you just hit the enter button without putting in the pin ?

The 28 had a facility for setting a pin number. If you dont have the pin you are supposed to return the unit to the factory.
In your case someone has put in a pin number . I'd have a bit of a peek around the eprom.dat with a hex editor. May not do any good but cant hurt.
Cheers
Jim

Mark
send me the serial.651 file. I have never used the software with this file
in place. Try making another eprom using the changed burner settings,
WITHOUT the serial.651 file.
The power on PIN is stored in the same way as the P channels, which I think
is in the EPROM.
or try the usual suspects like 1234, 1111, 0000 etc
ben

Does anyone out there have any info on the 8727 and what softwareyou use to program them?

Thanks in advance

Hi Paul,
You will have trouble finding software for the 8727. The set is crystal controlled. A later version of a 7727C. What do you want to know???

Ben (Fred???)

Serial file posted in files section as requested. I must admit to not knowing where this file has come from. There doesn't seem to be much in this file at all???

Have tried the usual number combinations with no luck. I will try burning another eprom tomorrow without this file. It all takes quite a lit of time, considering that I only have 2 eproms to work with. Did you mean that the pin information would be stored in the EEPROM, rather than the EPROM? If this has somehow been set (not that I have..) does one really have to send the set to Codan to 'undo' it??

Someone mentioned that thew 27c512 devices are available from motherboards of old 486's?? Is this correct. Also have you tried substituting another type of eprom that is electrically erasable? I am led to believe that it is called an AT29C512. Apparently it has the same pin outs as the 27C512...?? Just a thought for later when I get the basics sorted. UV erasing is a PITA.

Will fiddle about a little tommorrow and let you know how I go. Had no time today.

Cheers,

Mark

Hi Mark, yes the old 486 motherboards can yield some 512 eproms. Not sure about substitutes. Be careful as I once stuffed a radio well and truly by not being careful when replacing an eprom. Erasing is a great hobby :) I used to have an eraser with a timer but alas no more. Now I have to time my cooking manually. Take off for a coffee and goodbye 6 eproms.
As I mentioned before, it took me a long time and countless hours to get eprom programming down pat. There's a lot of experimentation and mistakes before the penny drops. I started a long way behind the 8 ball and a few patient souls fielded my ridicules questions. Luckily I'm a fast learner.

Take heart and realize that once learned, you will be able to churn out eproms at will. But even with pre programmed eproms etc if I have to do a non standard frequency it can take me an hour to set up, channel in and program. By the time you've done it, gone to the Post Office and posted it and returned, you can see the cost.

Cheers
Jim

Topic: 2533 Message: 2555

According to the 8528SMarine user manual I have here, the PIN is set up in the control head options set up mode (EEPROM??) and eproms prior to v 4.10 this is accessed via the jumper being placed in the setup position 1.

All the other set up options described seem to be EEPROM related such as P chanels. selcall settings etc.

IT does also say not to forget it in big writing or it has to be sent back to the factory to be reset. I havent followed all the emails about this topic but is it possible that the control already had a PIN lock code set by a prior owner?? If not please disregard my comments but I thought it was worth a shot,

If the radio was to be sent back to the factory, is there a master reset in the control head?? Most other commercial radios that I have seen with either a lock or are stunned have a master reset (short out two pins etc)or software control to reset the radio.

As far as the eeprom version of the 512 it should work so long as the data/address pins are identical but I have not heard of anyone using these on the codans, but on 27C64's equivalents.. might cost a bit more and you need turn the write Vpp volts off on your eprom programmer or you may cook it.
I cant remember the program lines for an EEPROM for write mode but you could probably find the data sheet on the web or your programmer already has the software control to do it for you.

You can get 27C512K eproms from DSE about $12.95 according to their website. Otherwise try Farnell, RS components... or better still old computer boards... then they are free!!
Jaycar only appear to have 27C256K

Any way my
$ 0.02

Mark
there is 4 bytes of info in the file

try 8025 as a pin....
Ben

OK an update.

Got a few spare eproms to play with. I think from having programmed a few now that the initial read I did of the first eprom became corrupted as none of the programming from that file will work...comes up queue full. With other bin files, such as the one Jim sent me, the radio powers up and asks for a pin number.

I have also slowed the programmer down considerably and it seems to program reliably and verify each time OK. Doesn't seem to be many problems here.

Prior to attempting programming, I was using the set with no PIN number set, so it appears that somehow, with all the mucking around it has just set itself. The serial 651 file seems to make no difference. I have also tried various numbers as pin numbers as Ben suggested but none seem to work. I will ring Codan and see whether they will assist without having to physically send the set back to them to unlock it. I hate to think how much they would charge for this service....??!

Still at it (in between real work and family)

Thanks for the help..

Mark

Jim
with due credit to John Jacobs, who posted this a while back
A - original version. Silicone rubber coupling between stepper motor and worm drive. Couplings fail after a time due to grease softening the silicone.
B - Black plastic flexi-coupling. This was shrot lived version as the coupling was brittle.
C - New style silicone coupling reinforced with spring clips. The silicone grease which used to attack the A series was replaced with a graphite coating on the leadscrew.
D - Contact spring rivetted to the tuning slug at one end.

D is the latest, as far as I have seen

Hello all, whilst following this thread I have also had time to check through the Codan Service Bulletins at work. and came across the following.
I Quote:
"Service Bulletin 17 - 00100 ISSUE 1 JUNE 1991"
8525B/8528 Series Tranceivers
Tranceiver Inoperable After Eprom Change.
Symptom
On changeover of a new Eprom into a working tranceiver, at switch on the front panel controls do not work, but
do work when the original Eprom is refitted. This has been identified as being due to different characteristics of the
new Eprom which may be from a different manufacturer than the original.

Remedy
Identify L1 (small round green RFC (RF Choke)) near Pin 40 of the microcontroller, 80C31, IC11. This is mounted
on the Microprocessor PCB 08 03742, drawing 04 02541.
If L1 is a 100 µH choke (marked 101), momentarily short circuit the choke, or ground Pin 20 of the microprocessor IC11.
If the tranceiver operates, replace L1 with a 4.7 µH choke (marked 4R7) available from the Codan Service Department.

Note
If the choke is the correct value and the unit fails to operate as above blah blah contact Codan Service Department.------

Anyway, may not be the right thing but it is the only bulletin I've found, so far, that is anything like the problem
reported, no mention of the "PIN" coming up after programming a new Eprom at least.
If anything, Jim gets an additional Codan Service Bulletin for his collection. :-))

Regards,
Sam.

Hi Malcom,

thanks for the reply,

there was one on ebay - "prograqmmed with"

I was interested in placing a bid but didnt know much about them.

I have an old Codan 7005 which essentially has the same design as the 6924..they are very frequency selective in their design -the coloured tuning slugs etc. Were the later model 7727 8727's easier to shift in frequency? ie did you need to replace any tuned circuits or just a crystal change and retune??

Regards

Paul

Does anyone out there have any info on the 8727 and what softwareyou use to program them?

Thanks in advance

2564. Re: [codan_outback_radio] 9350 models

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-04-06 13:54:57 UTC
From: Sam Point
Topic: 2557 Message: 2564

Here is something interesting though Ben.
I have just unpacked from a box one of the last 9350's we got with the
last batch of 9323's we received.
It is marked as an "A" model, curious, it also has a serial number of 6
digits not 4 digits like all our other A,B,C and D models (e.g: A1245 or
D0134.)
also the A and all writing is in a different Font as well. I'll check
the latest units to arrive, which came in with 2 NGT AR-Voice units,
last week and see
what they are tomorrow.

Regards,
Sam

Geez Sam, first Ben makes the s/n thing as clear as mud, and then ya go and throw in something like that. Sheesh ! .....:))

Cheers
Jim
PS. You're right, I didnt have that TSB about the eproms :)

From: Malcolm at "On- Track 4WD" in Greymouth
Topic: 2337 Message: 2566

Hi Paul, no you only replace the crystals. They seem to perform well but you would do much better to look at a 8528 or 8525, something that can be programmed will give you a better range of channels. If you want a base then the 8727 would be great for that. They also don't have sellcall fitted and require an 8422 fitted for that purpose. They can also be hard to find. As a set the 8727 is pretty bullet proof.

Hi Malcom,

thanks for the reply,

there was one on ebay - "prograqmmed with"

I was interested in placing a bid but didnt know much about them.

I have an old Codan 7005 which essentially has the same design as the 6924..they are very frequency selective in their design -the coloured tuning slugs etc. Were the later model 7727 8727's easier to shift in frequency? ie did you need to replace any tuned circuits or just a crystal change and retune??

Regards

Paul

2570. Re: [codan_outback_radio] Re: 8727

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-04-07 07:18:54 UTC
From: Jim
Topic: 2337 Message: 2570

oooh.....nasteee. heheheh I found that sometimes a couple of days away from it helps. I assume (I should know shouldnt I) that the component that holds the password....eeprom...is on the cpu board ? I have a speare 25a one and possibly a spare 25B (same as 28) one coming. All is not lost, hang in there.
Cheers
Jim

2572. Re: [codan_outback_radio] 9350 models

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-04-08 07:38:34 UTC
From: John Jacobs
Topic: 2557 Message: 2572

I've checked with the Adelaide factory. D is still the current version. No change to the numbering system.

regards

John

Sam Point <spoint@...> wrote:
Here is something interesting though Ben.
I have just unpacked from a box one of the last 9350's we got with the
last batch of 9323's we received.
It is marked as an "A" model, curious, it also has a serial number of 6
digits not 4 digits like all our other A,B,C and D models (e.g: A1245 or
D0134.)
also the A and all writing is in a different Font as well. I'll check
the latest units to arrive, which came in with 2 NGT AR-Voice units,
last week and see
what they are tomorrow.

Regards,
Sam

2573. 9323 SWR Display

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-04-10 00:37:38 UTC
From: Mike Richter
Topic: 2573 Message: 2573

This seems to be an undocumented feature.

When you activate uV dB Display (Mode-3-1-4) you get a display of signal strength in decibels and microvolts - limited usefulness unless comparing antennas.

However when Tuning, it uses the internal SWR sensors to calculate SWR. Along the top it displays "SWR1.9" and the bar graph shows "sw.:|".

Handy if you're not getting out, and you are wondering if the antenna is working ok.

Mike VK2BMM Romeo14.

Mike, I suspect that the 9323 has a few undocumented features. One of
XP's files mentions an amateur option. Then there's any differences
between exported and local models. Perhaps with the right pin
activation codes we could use it to cook dinner :))

Cheers
Jim

After the antenna is tuned or if on a fixed antenna if you press and hold the tuned button if for a second the swr will be displayed for longer so you can read it easier.

2578. Codan Radios, 35 amp power supplies and Bushcomm Antennas For Sale

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-04-17 02:57:15 UTC
From: Graeme and Lillian
Topic: 2578 Message: 2578

A friend of mine has some Codan Radios for sale. They are 8525's and are in excellent condition. He also has a number of GME 35 amp power supplies that also are in pristine condition. The antennas are Bushcom SWE100 or there abouts. For futher details phone Rod Bowkett on 07-49925812 in Biloela, Central Queensland.

From: Jim
Topic: 2580 Message: 2580

I'm casting around for some form of tuner that will match an earlier Codan to the backstay on a boat. Anyone know of anything suitable for sale ?

Cheers
Jim

Jim,

friend of mine used a manual tuner (inside the cabin) quite successfully all over the pacific.

Alternative would a waterproof generic auto tuner mounted above the deck (to try to keep it dry. Note that the feed point may be hi voltage.

Dave

Hello All
Just to let you all know the Codan 9103 Tuner is Waterproof and has a Very high Voltage point at the Ceramic Output Terminal.

I have one and it works a treet, but do not go over the Recommened Length of Wire for the Antenna, as It cause problems inside the Tuner, and I have the Jumper NOT to remember the Tune Freq point.

Tune every time as you move the Antenna around.

Dont use a Tuned Fixed Antenna on the 9103 Tuner as well, as it is already at 50 Ohms at the feed point.

Hello Jim
The Codan 9103 Tuner is still current stock, and you can also use the Barrett 911 Tuner as well.

Both are made by SGC in the US, and just rebadged to suit the above componies.

Jim,

The standard Codan 9103 autotuner works fine up to 150W on a backstay antenna. You'll need to keep the feedline (between tuner and backstay) as short as possible.
If you're using the old 4404 400W amp which was specifically designed for marine use, you'll need to look out for a 4203 tuner to match.

Good luck

John

2587. hf helical antennas (outbacker type)

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-04-19 00:54:59 UTC
From: wdphil2003
Topic: 2587 Message: 2587

Hi Guys,

Ive got a out-back type antenna ~6' tall with 9 taps. The antenna was dammaged and has been repaired/rewound but I dont know what for frequencys as the original cover is no longer there (I Beleive it was for RFDS & Telstra). The SWR is no good for the FReqs I want to use (3995, 5455,8022,11916,14977). I would like to rewind the antenna and have just the 5 VKS737 freqs + mabey one RFDS(2020) freq. Does any one know of have a way of calculating the number of turns/size of antenna/ size of wire formular? Etc.

Any Help would be good.

Phil

Terlin will retap aerials. The problem with retapping them yourself is that it's really a matter of suck it and see. Since the wire is fibreglassed over, one has to remove the fibreglass to expose the wire. You then have to remove the outside coating of the wire to tap it, determine its frequency and impedance etc , and do this until (if you're lucky and persistant) you find the correct spot. It's a lot of very time consuming frustrating work. Remember that the turns are very close together.
Personally, having done a few using an antennae analyzer which I bought just to do the job, I'd rather strip the old aerial and start afresh. That way you can use formulae etc of your own choosing.
Cheers

Possibly there is. But maths and the real world often diverge. There's still
a certain amount of experimentation necessary. And even when you've finished
you're still not going to have the finish of the commercial product.
I guess there's a reason why companies spend big $ on R@D, production
facilities, marketing and distribution. And with a market that's fast
disappearing, it's no wonder that the new ones cost so much.
Another problem is that if you tap them for say 5 737 frequencies, what does
one do for a bush telephone service ? More taps.
Oh and don't forget that when you hit the right (or should that be "sweet"
in today's language?) spot, you then have to check everything by mounting it
back on the vehicle. After a few dozen trips it's no wonder that one can
come up with some very creative language. I know I did :))
Cheers
Jim

2592. RE: [codan_outback_radio] hf helical antennas (outbacker type)

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-04-19 02:07:20 UTC
From: Jim
Topic: 2587 Message: 2592

One method is to wind a continuous coil using the same tpi. Check the
frequency and impedance at 2 points, say 5cm apart. The frequency difference
will give you a pointer. The problem here is that the diameter of the whip
tapers, so these measurements aren't much good over a long section of rod.
Cheers
Jim

Subject: RE: [codan_outback_radio] hf helical antennas (outbacker type)

Terlin will retap aerials. The problem with retapping them yourself is
that
it's really a matter of suck it and see. Since the wire is fibreglassed
over, one has to remove the fibreglass to expose the wire. You then have
to
remove the outside coating of the wire to tap it, determine its frequency
and impedance etc , and do this until (if you're lucky and persistant) you
find the correct spot. It's a lot of very time consuming frustrating work.
Remember that the turns are very close together.
Personally, having done a few using an antennae analyzer which I bought
just
to do the job, I'd rather strip the old aerial and start afresh. That way
you can use formulae etc of your own choosing.
Cheers
Jim

Subject: [codan_outback_radio] hf helical antennas (outbacker type)

Hi Guys,

Ive got a out-back type antenna ~6' tall with 9 taps. The antenna was
dammaged and has been repaired/rewound but I dont know what for

frequencys as the original cover is no longer there (I Beleive it was for RFDS & Telstra). The SWR is no good for the FReqs I want to use (3995, 5455,8022,11916,14977). I would like to rewind the antenna and have just the 5 VKS737 freqs + mabey one RFDS(2020) freq. Does any one know of have a way of calculating the number of turns/size of antenna/ size of wire formular? Etc.

Any Help would be good.

Phil

2593. RE: [codan_outback_radio] hf helical antennas

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-04-19 02:15:33 UTC
From: Jim
Topic: 2587 Message: 2593

Ok my last words on the topic. (thank goodness says everyone:). When you've finally spent a zillion hours getting the taps right, there's one more hurdle. Weatherproofing. Whilst its understandable to want to yahoo through the bush with your new "I did it myself" whip, if you hit treebranches etc often enough, the outer coating will suffer. Water is a nasty thing inside the whip. Be sure to enclose it with fibreglass and possibly some of the glue on the inside type heatshrink. Not cheap, takes time (again) but your new whip may last a lot longer.
Cheers
Jim

2594. Re: hf helical antennas

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-04-19 04:32:41 UTC
From: Mike Richter
Topic: 2587 Message: 2594

Tuning antennas for HF is a real pain because you have to be so precise.

That's why I've spent $330 on an Automatic Antenna Tuner - a box about the size of two VHS tapes which can automatically tune just about any antenna to any frequency within seconds. Great for Amateur band use !

I have nearly finished and Interface box to go between a Codan 9323 and an LDG-Z100 AutoTuner.

I am using it with an Outbacker, which I set to the highest frequency I plan to use - and the AutoTuner does the rest. (This gives better efficiency than just using an 8 foot wire whip). It also gives me backup - if the AutoTuner fails, I can still operate on the frequencies that I have taps for.

Yes, a viable alternative. But just thinking anout the radiation effeciency. I suspect that most whips aren't great in that dpt., but it's interesting that Codan put their matching tackle in the air rather than in a box. Just an observation.

Cheers

through
> the bush with your new "I did it myself" whip, if you hit
treebranches etc

Just a quick note for your home brew antenna.. if you have set all your taps on the antenna and have not put any covering you will want to note that you will shift the tuning of the antenna down in frequency by doing this..
- having an adjustable tip will help by allow small shift in frequency... or changing the wander lead length just slightly

Regards

Paul

to follow on from Jim's comment...Its a fact of physics that once your signal leaves the co-ax it will radiate. So, if the tuner is inside the vehicle and max power of a momopole is radiated from the bottom third of the antenna...you are losing precious watts warming up the occupants of the car.

regards

John

Jim <jimshire1@...> wrote:

If 10 watts was being wasted in the antenna Tuner it would become untouchable after a few minutes of transmitting at 100 watts - but it doesn't even get warm.

Most power radiates from the bottom third of a monopole because that is where most current flows. That is same current flows through the Low-pass filter coils inside the Codan and the coax - without losing one third of the energy there.

There is some loss in Tuner, but it is small. If I just connected an 8 foot wire whip then at 10 MHz the antenna would be very inefficient - which is why I am using an Outbacker to be an efficient radiator at the high frequencies. The Tuner then "lengthens" the antenna when I want to operate on a lower frequency.

2599. Re: hf helical antennas

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-04-19 11:40:25 UTC
From: d zilm
Topic: 2587 Message: 2599

Very basic description of quite an involved (well for most people) topic.

Less simply put;

The length of the radiator will determine its efficiency. For any given freq the antenna efficiency will change with the length of the radiator (assuming an effective impedence match to transmitter).

Which brings the next point. The (primary) purpose of the antenna tuner is to provide a constant (usually 50ohm) no-reactive load to the transmitter, in order to get max output from the transmitter (and not blow the finals due to the effect of reflected waves).

For an antenna to be efficient it most be naturally resonant at the freq intended for it to be used on. Anything else will be less efficient.

Antenna in (odd) multiples of 1/4 wave at the transmitting freq are typically the closest in impedance match for modern transmitters (at 50ohmns). Open wire (ie 300 or 600 ohmn balanced) lines are usually achieved via coupling components in the transmitter (tank) output cct, but are not typically seen in general mobile / portable use.

A good SWR / match does not make the antenna any more efficient. It just permits the TRXCVR to provide more tx power without suffering from reflected waves.

Interestingly, while travelling the simpson I broke my primary antenna (high speed impact with tree). It was a tapped multi band helical whip. Subesquent use of a 1/4 wave wire off the antenna base provided a better rx & tx signal. The difference was due to the polarisation, and resulting propergation. Temp antenna was about 8m of ex Overland telegraph wire, suspended between a shovel & the antenna base on the bullbar.

Plenty good text (at reasonable prices) in Antenna Impednace Matching by Wilfred Caron, and various ARRL Antenna Handbook.

Dave
No B .Eng, but lots of functional antenna overt the years.

I'm not sure that I should of opened my big mouth on this topic. If there's one thing that's guaranteed to rev up the convo it's a "discussion" involving aerials. It's a fascinating field that we approach from our own viewpoints I guess.

A quick personal story if I may.

When Fred Flintstone was a boy I was considered by some (easily fooled) to be a boy geni ass. (I was cheap to keep) In other words I lived my job doing stuff like radcomms, TV, med. electronics etc. I was very young and naive, and was probably one of the original nerds. I was so bad that I could hardly hold a non technical conversation for very long. (hard to believe but true) Now when one nerd met another nerd back then we used to play a game called "I know more than you". I became bored with this game after a while as it didn't seem very productive and someone always knew more than I did anyway. Despite their degrees, I was the poor sod who ended up at the sharp end of not only designing but making it work. And fixing it when it often didn't. I eventually saw the error of my ways and got into a different profession.

And got a few degrees of my own. In fact a whole suitcase of useless paperwork telling everyone how wonderful I was. I could now play another game. It was called "What, only an undergraduate degree?". Same game, different name, just as productive.

One of the wonderful things about this list is the wealth of knowledge and experience held by its members, and their willingness to help each other. There are some great people here, and one of the things I like is not having to play what I (now in my dotage) refer to as the "nerd game". Rank novice or experienced Engineer in charge, we all have something to contribute.

For my money an educated person exhibits two kinds of behaviour; an awareness of what he doesn't know, and a willingness to learn. And so back to aerials. If it works for you then great, I'm all ears even if I've been there and done that many times.

(I won't recount a story about RF engineering labs, whips and radiation efficiency...the verifiable numbers were too scary but did it make a practical difference ? Thousands were produced and sold, all used by happy oblivious HF users. I'd love to namedrop but I think it's called commercial confidence ...)

Oi ! I heard that ! Who said "for %(*&%^*&^&*(sake Jim SHUDDAP!" (me...and me...and me .....):))))

Cheers
Jim
(and yes when someone is trying to teach me to suck eggs, I do
"accidentally" think "I've forgotten more..." etc etc. I probably haven't,
but it's the refuge of the old and forgetful:)

Just a quick note for your home brew antenna.. if you have set all your taps on the antenna and have not put any covering you will want to note that you will shift the tuning of the antenna down in frequency by doing this..
- having an adjustable tip will help by allow small shift in frequency... or changing the wander lead length just slightly

2604. Interference from Fridge - How to reduce it ?

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-04-20 01:59:16 UTC
From: mal1958au
Topic: 2604 Message: 2604

Hi,
I don't have an outback radio, but go 4wd driving and camping etc. I am also interested in shortwave radio and with both interests is one of the reasons why I joined this group.

On a recent holiday away to Tassie, I decided to take one of my portable battery operated receivers (Sangean ATS 803)for a spot of DX'ing etc.

I noted at different times that across the SW bands that there was an intermittent low level signal that sounded like crickets chirping.

I observed that this signal was being generated when the compressor on my 12v fridge was running. No signal was being generated when the fridge was idle or turned off.

I have a "Bushman" fridge which uses the danfoss compressor that is also used in the Waeco, Evacool etc fridges.

Since this type of inteference is likely to also be a problem for users of the outback radios and hence there are some likely possible strategies, what are some of the recommended ways to reduce the inteference caused by my fridge.

Cheers,
Mal58

2605. Re: hf helical antennas

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-04-20 02:00:38 UTC
From: Mike Richter
Topic: 2587 Message: 2605

> The length of the radiator will determine its efficiency.
- very true, once the length goes below 1/12th wavelength the efficiency drops off dramatically i.e. less than 8 feet at 10MHz.

> The (primary) purpose of the antenna tuner is to provide a constant (usually 50ohm) no-reactive load to the transmitter,
- very true

> For an antenna to be efficient it most be naturally resonant at the freq intended for it to be used on.
- not true, a antenna 10% shorter or longer than quarter-wavelength isn't much less efficient, it just has an impedance which won't match to a transmitter without a tuner.

> Antenna in (odd) multiples of 1/4 wave at the transmitting freq are typically the closest in impedance match for modern transmitters (at 50ohmns).
- true - BUT we still make use of other lengths. 5/8 has an excellent radiation pattern but lousy impedance match - which is easily corrected to 50 ohms with a few turns (at VHF) of wire at the base.

> A good SWR / match does not make the antenna any more efficient. It just permits the TRXCVR to provide more tx power without suffering from reflected waves.
- true, but a lousy impedance doesn't render an antenna useless. A 1/2 wavelength will not match to a 50ohm transmitter, but it is a very useful antenna if you match to its high impedance.

But physical and electrical length are different. There are two ways of matching a less-than-1/4wave-physical antenna - a straight wire with an impedance-matching network-in-a-box that doesn't radiate - or impedance matching on the aerial that does radiate
-base-loading
-centre-loading (Codan/Barrett)
-top-loading (Outbacker above lowest frequency tap)
-continuous-loading (Outbacker at lowest frequency tap)
A radiating impedance network is more efficient than a tuner

So why have I stirred things up by recommending the less-efficient tuning shared between antenna (Outbacker set to highest planned frequency) and other frequencies using Auto Tuner ?
- it is more efficient than an 8 foot straight whip with autotuner
- the Outbacker can be manually set if the Autotuner fails
- An outbacker is smaller, more easily removed and stored, more easily mounted than a Codan/Barrett.

- It tunes faster (fraction of a second once frequency is in Tuner memory) than a Codan/Barrett
- Cheaper than Codan/Barrett (esp. if you pick up Survivor 27 inc base for $50 at Wyong !)
- less theft-prone if I use a $20 CB antenna (with less efficiency), I can keep a couple of spare whips in the car.

Mike

Mal

I have a 2-yr old Waeco which produces no HF interference - so it
looks like it can be fixed.

You need to
- earth the case of the compressor
- place a ceramic capacitor across the 12 volts leads directly at
the compressor
- place an inductor in series with both 12 volt leads at the
compressor.

A car audio interference suppressor rated at 10 amp (Dick Smith,
Jaycar etc) will provide the capacitor and inductor in one package.

Mike

What do you mean by the shorted turns thing?

If you mean adjusting the wandering lead and testing the reflected power at each tap point & frequency I have + tryed some adjustment of the tip I Have. I've also tried a aligator clip on the end of the wire and moving it around the antenna.With out much success as yet.

This is when I thought I might rewind the antenna. I havent been able to find any formulas for heleical whips on the net only "bug catchers" & "dipoles". IE a big coil in the middle of the antenna which doesn't sound to atractive to a 4WD'er and not real good for freq changes..

p.s Jim I have access to glue filled heat shrink & loads of wire so the finishing it off wont be a problem (if I can just get the dam thing tuned).

Before doing the final heat-shrinking, I suggest you slip the tubing over the antenna to see if its tuning has changed much.

I have an Autek HF Antenna Analyser which makes life easier - what part of Sydney are you in (I'm at Hornsby)

If you have a peek at the Terlin aerials you'll find that they have "knobs" at various points. These appear to be 2 shorted turns around the winding at that point. I'm guessing that this is a method of raising the resonant frequency slightly to compensate for the finish, and perhaps broadbanding that particular tap slightly....I could be wrong on both counts but thats my guess.
I recently bought some of that special heatshrink in the larger dia. Cost me $100 for 2 1m lengths so its not cheap.
Cheers
Jim

the antenna.With out much success as yet.

This is when I thought I might rewind the antenna. I havent been able to find any formulas for heleical whips on the net only "bug catchers" & "dipoles". IE a big coil in the middle of the antenna which doesn't sound to
atractive to a 4WD'er and not real good for freq changes..

p.s Jim I have access to glue filled heat shrink & loads of wire so the finishing it off wont be a problem (if I can just get the dam thing tuned).

Phil

Thanks for the tip Paul, I did forget to mention the whip does indeed
have
an ajustable tip.

Subject: RE: [codan_outback_radio] Re: hf helical antennas

Just a quick note for your home brew antenna.. if you have set all your
taps
on the antenna and have not put any covering you will want to note that
you
will shift the tuning of the antenna down in frequency by doing this..
- having an adjustable tip will help by allow small shift in
frequency...
or
changing the wander lead length just slightly

Regards

Paul

2611. Antennas tuning etc. RE: [codan_outback_radio] Digest Number 598

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-04-20 02:58:04 UTC
From: David Wilkins
Topic: 2611 Message: 2611

I've just read 16 messages in one go about antennas, tuning etc.

My only comment is that the matching box should officially have an official name change from "Antenna Tuner" to "Impedance Matcher".

I am not a technical expert however I use the imperfect example of a car when trying to explain the issue to non technical people as follows: Motor (transmitter), gearbox (impedance matching device = Tuner), and wheels (antenna). To get best performance you need a matched set of all three components otherwise you will get poor overall performance.

Generally as you change motor revs (frequency) you have to change gear (impedance) to transfer the power from the motor to the fixed diameter of the wheels (antenna). If you travel at only one rev setting (frequency) and have selected the correct wheel size (antenna length) then you can do away with the gearbox (tuner) altogether. As you may notice in a small boat or aeroplane where the propeller runs at a fairly constant revs the pitch of the propeller (=wheels) is fixed as the load is constant and no gearbox is required.

An example of a serious mismatch is that of a V8 motor (big transmitter) coupled through a gearbox (tuner) to a set of wheels off a Fiat Bambino (whip aerial). As you can imagine you will have a lot of screaming motor noises, a hot gearbox and a poor performing vehicle as the Bambino tyres try to make things happen.

It is therefore no wonder that whips aren't the best alternative as you are not efficiently using the power you are putting into them. Extending the analogy further to the Codan world maybe you can visualise the Codan tuneable aerial as a combined gearbox and wheel size changing device stuck on the front of your 4WD. It cannot escape from the small wheel (whip) syndrome but at least the best match is being made at the base of the radiating element not inside the vehicle.

I do a lot of portable work (tramping and SAR in the bush) and all I use is a variable length dipole usually about 2 metres off the ground. This produces what is known as Near Vertical Incidence Skywave (NVIS) propagation and is excellent for the shorter haul distances out to say 600 km though I have worked over 1000 km on 5 Watts under the right conditions/frequency combination. As I adjust the aerial length to get the correct match (low SWR) I do not have to use a "Tuner" at all.

I hope this little bit of information helps someone understand the issue better. Either that or I have just proved once and for all my ignorance of the subject.

I'm glad you've raised the subject of Near Vertical Incidence Skywave (NVIS) (it will save me from getting an earbashing for raising it !!!)

The aerial-mount that I've built for the rear tyre-mount of my Pajero is designed to allow for an NVIS antenna. I have a threaded mount at 30 degrees above horizontal for when stationary and also another socket for connecting a horizontal above-the-roof whip for use when driving. Yes, it will look ridiculous (nickname the Unicorn etc etc).

Why ???? I hear everyone asking (with trepidation over the length of the email and number of replies)

- because a vertical antenna (Codan/Barrett/Outbacker) is lousy for short-distance HF (<500km) communications. It sends the most signal out horizontally, when it is actually need vertically. That's where the Tank-whip antenna is more versatile. Ever since Vietnam, military users have pulled the whip over to achieve short-distance HF (<500km) (hard to do with a Codan/Barrett/Outbacker !)

When I get a lot more time (and my wife is overseas) I will build up the rooftop NVIS antenna.

Mike

2615. RE: [codan_outback_radio] Interference from Fridge - How to reduc e it ?

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-04-20 03:46:53 UTC
From: Rogencamp, Philip - Sydney
Topic: 2615 Message: 2615

You could try some of the old favourites. Like a RF choke on the power leads (a few ferrite beads near the fridge end of the power lead) or if your electronically inclined a capacitor across the compressor power leads could work wonders try a ceramic 0.1uf to start with (you could try a few different value ones till you get the best result as there quite cheep). I had a similar problem a few years ago with a cheap car fridge fan and 27Mhz CB the capacitor almost completely fixed the problem. You could also use 3 capacitors. cap 1. one side to +ive the other to fridge chassis. cap 2. one side to -ive the other to fridge chassis. cap 3. one side to -ive the other to +ive.

Or turn off the fridge while listening to the radio.

Just a few ideas.

Phil

Subject: [codan_outback_radio] Interference from Fridge - How to reduce it ?

Hi,
I don't have an outback radio, but go 4wd driving and camping etc. I am also interested in shortwave radio and with both interests is one of the reasons why I joined this group.

On a recent holiday away to Tassie, I decided to take one of my portable battery operated receivers (Sangean ATS 803)for a spot of DX'ing etc.

I noted at different times that across the SW bands that there was an intermittent low level signal that sounded like crickets chirping.

I observed that this signal was being generated when the compressor on my 12v fridge was running. No signal was being generated when the fridge was idle or turned off.

I have a "Bushman" fridge which uses the danfoss compressor that is also used in the Waeco, Evacool etc fridges.

Since this type of inteference is likely to also be a problem for users of the outback radios and hence there are some likely possible strategies, what are some of the recommended ways to reduce the inteference caused by my fridge.

Cheers,
Mal58

I don't have an outback radio, but go 4wd driving and camping etc. I am also interested in shortwave radio and with both interests is one of the reasons why I joined this group.

On a recent holiday away to Tassie, I decided to take one of my portable battery operated receivers (Sangean ATS 803)for a spot of DX'ing etc.

I noted at different times that across the SW bands that there was an intermittent low level signal that sounded like crickets chirping.

I observed that this signal was being generated when the compressor on my 12v fridge was running. No signal was being generated when the fridge was idle or turned off.

I have a "Bushman" fridge which uses the danfoss compressor that is also used in the Waeco, Evacool etc fridges.

Since this type of inteference is likely to also be a problem for users of the outback radios and hence there are some likely possible strategies, what are some of the recommended ways to reduce the inteference caused by my fridge.

Cheers,
Mal58

Topic: 2587 Message: 2619

Mike,

I think you missed my main point, or more likely I didn't explain what I meant.

No argument that that the tuner doesn't contribute loss. As you say if it were lossy, it would get hot. However, the tuner does contribute to the radiation of the antenna and, as we agree, max current flows at the base of the antenna. Thus if the tuner is inside the vehicle, most of that radiated power produced inside will be absorbed by the metalwork.

This is why the Codan solution is better; the whole tuning section is outside the vehicle. Any radiation contributes to useful signal.

Best regards

John

ps. you can make your Codan 9350 less theft prone by putting a padlock through the hole at the bottom of the mounting bolt. JJ

So why have I stirred things up by recommending the less-efficient
tuning shared between antenna (Outbacker set to highest planned
frequency) and other frequencies using Auto Tuner ?
- it is more efficient than an 8 foot straight whip with autotuner
- the Outbacker can be manually set if the Autotuner fails
- An outbacker is smaller, more easily removed and stored, more
easily mounted than a Codan/Barrett.
- It tunes faster (fraction of a second once frequency is in Tuner
memory) than a Codan/Barrett
- Cheaper than Codan/Barrett (esp. if you pick up Survivor 27 inc
base for $50 at Wyong !)
- less theft-prone if I use a $20 CB antenna (with less efficiency),
I can keep a couple of spare whips in the car.

Mike & others,

We are of course taking electrical length (which will be different to physical (in all cases I can think of)

Naturally we are aiming max efficiency (since that should be the goal before we do practical or commercial trade-offs) ie ideal world before 'short cuts' are taken.

Thanks for expanding on my points. Good discussion points, particularly on the impact of various matching / loading techniques that some may not have been aware.

dave

- not true, a antenna 10% shorter or longer than quarter-wavelength
isn't much less efficient, it just has an impedance which won't match
to a transmitter without a tuner.

Philip

But when you find it doesn't work, you'll now feel a lot better, because we've explained that it isn't "just a piece of wire"

- it is a device to match the complex impedance of the transmitter to the impedance of free space, while radiating most electromagnetic energy in the optimum direction

Now this is a whole new ball park. I assume you mean a manual atu, rather than an automatic u beaut tunes everything instantly black box ? :))
Two suggestions.
If you're thinking manual have a think about buying one of the older Codan or Barrett marine tuners. They can be sourced reasonably cheaply (I've just done it), and work well. Saves a lot of time and hassle.
If thinking auto matching device (!), grab what Mike has. About $360 ?and they are an absolute gem in terms of doing almost anything with a bit of wire/whip.
And if you absolutely positively have to build one , see if you can source some circuits of Tokyo tuners. There was one that could be "reversed" to cater for different feed impedances. I used it on everything a few years ago. Unfortunately it was on loan from a boat :((
Cheers

2633. Codan X2 SSB Units

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-04-21 07:21:49 UTC
From: mal1958au
Topic: 2633 Message: 2633

People,
There are a couple of Codan X2 SSB units advertised on E-bay at the following url.

http://cgi.ebay.com.au/ws/eBayISAPI.dll?ViewItem&item=3092889161&category=3308

Does anybody know much about these, ie power output, how easy to program, frequency range, approx how old etc.

Also, your considered opinion on whether they would be worth having in comparison to any other Codan Units.

Cheers,
Mal58

Does anybody know much about these, ie power output, how easy to
program, frequency range, approx how old etc.

Also, your considered opinion on whether they would be worth
having in comparison to any other Codan Units.

Cheers,
Mal58

Jim I have a copy of the instructions for the kit here somewhere and
from memory it uses a wire to an adapting ferrule screwed to the top of the
9350 tuner instead of the normal whip.
I'll try to find it and peruse it deeper and let the group know.

Sam.

2637. An interesting ad

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-04-21 12:06:43 UTC
From: Jim
Topic: 2637 Message: 2637

Just noticed an ad on ebay to increase talk power of some early Codans. He's selling some info from a Codan TSB. Now why didnt we think of that ? Can see Ebay with such ads. "Don't let your valuable Codan overheat! For just $9.99 you get the following info from Codan TSB number XXXX".
Hmm. I'm not knocking the advertiser, just amazed .

Cheers
Jim

2638. Codan 708 tuner

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-04-22 02:15:59 UTC
From: Jim
Topic: 2638 Message: 2638

Well the little box arrived and I connected it to the tx and a wire aerial.
Hmm...tuning is strange. Press the button and..hmm...nothing comes up on the
meter. Ok open up time. No diode from pickup coil to meter. Just straight RF
across the meter. Rectified this (!) and meter indicates, but something
isn't right. Give it the intense visual inspection and guess what, the earth
is wired to the output terminal. As in ON the output terminal. I may be
thick at times but I think I've just seen evidence of someone who's thicker
!
Now the meter indicates too well. FSD on higher frequencies with about 20w.
Ok, looks like a preset pot is needed across the meter. Hang on a
minute...this is a CODAN unit. Obviously a much hacked one.
Anyone got a circuit ?
Cheers
Jim

2639. Tuner

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-04-22 04:09:16 UTC
From: Jim
Topic: 2580 Message: 2639

Interesting. Hidden in the wire from earth to active is a resistor of several meg, I suppose to bleed off any static. Good job I thought I was going mad, the resistor was about 1/3 of its value anyway.

Cheers
Jim

2640. HF mobile antennas

Yahoo group: codan_outback_radio (1997 — 2004)

Centre loaded antenna (with solid lower half below centre-loading) arent to difficult to make, but unfortunately req individual loading coils.

Use a constant length 27MHZ CB antenna for the top portion.

Looks different, and obviously not CB - so discourages being 'borrowed' - partly by the fact the 'normal' CB part is 2.5->3m in the air.

Use two ant mounts and switch between the desired freq whil on the move - no moving the wander lead :-)

Another trick for multi-frequency antennas (without ANY retuning) is to have three tops on a single base

e.g. a 1 meter mast with an adapter plate that holds three loading-coil + whip.

This popular for amateur band where you but one base intended to be used alternately with tops for 7MHz, 14MHz and 21MHz.

Mike

Anyone want it for free?
I have a copy of that TSB. Once I dig through my manuals that is.
Jeez some people will charge a lot for some things! It probably cost him nothing and is just waiting
for suckers to buy 3 A4 pages which when I dig it out and scan it in, will be available, on request, to the group.
Most of these older CODAN TSB's have been thrown out by agents and company service sections, as they no longer use these
models (Includes 6801, 7727B, 8525, '25Band 8528 (Upto a certain serial number though.) and CODAN no longer
supports the models in the TSB's.

2646. autotune not auto tuning

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-04-22 12:10:36 UTC
From: Mick Barson
Topic: 2646 Message: 2646

G'day All

Had my 9320 autotune play up on me today, would not tune in on any of the VKS frequencies, haven't had a chance to try any others or look closely as to what the problem maybe, connections into the aerial all secure and clean.

Any ideas?

Cheers
Mick

2647. Re: [codan_outback_radio] autotune not auto tuning

Topic: 2646 Message: 2647

Mick
do you get any error message on the radio? Does it fail to tune instantly or does the antenna seem to tune through its range and then fail. What radio are you using.

possible causes are
No TX power from the radio
broken control cable or antenna coax
broken/missing whip top from antenna
mechanical failure of the antenna (worm drive coupling is broken)
electronic failure in the antenna (very unlikely)
vehicle is parked under a shed/tree etc

cheers
ben

Mondo went belly-up about five or so years back.

You're on your own re repairs unfortunately, and they never provided
ANY circuit info that might let techs work it out.

Peter

2653. O/T What's it worth?

From: Jim
Topic: 2653 Message: 2653

Sorry for the O/T but
I've been offered a Barrett 550 and modem. I believe the 550 is the equivalent (but not as good of course:) Codan 9323 ? Haven't seen any 550's on ebay etc and just wondering if anyone knows of a rough price for the above.
Cheers
Jim

2654. Glue lined heatshrink

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-04-27 04:08:25 UTC
From: Richter, Mike W
Topic: 2654 Message: 2654

Jaycar are now selling glue lined heatshrink at good prices

1.2 metres of 19.1mm for $7.95 (WH5606)

You could just overlap it to cover a 2m aerial - the glue will make it watertight.

If you just want to seal the ends of non-glue-lined heatshrink I recommend using "Urethane Bond" glue. Silastic hardens before the tubing shrinks and leaves a lumpy finish.

Mike Richter

Subject: Re: [codan_outback_radio] Glue lined heatshrink

It does the trick, I made a 6ft braided whip for my auto tune and used two lengths to cover it, It is quite durable and has already been on a few tracks through thick scrub and has not been cut.

"Richter, Mike W" <michael.richter@...> wrote:Jaycar are now selling glue lined heatshrink at good prices

1.2 metres of 19.1mm for $7.95 (WH5606)

You could just overlap it to cover a 2m aerial - the glue will make it watertight.

If you just want to seal the ends of non-glue-lined heatshrink I recommend using "Urethane Bond" glue. Silastic hardens before the tubing shrinks and leaves a lumpy finish.

Topic: 2661 Message: 2661

I know of a guy who got one last year with a tuner but without the modem for
$750.
I'd say $500?

From: "Jim" <jimshire1@...>
Subject: O/T What's it worth?

Sorry for the O/T but
I've been offered a Barrett 550 and modem. I believe the 550 is the
equivalent (but not as good of course:) Codan 9323 ? Haven't seen any 550's
on ebay etc and just wondering if anyone knows of a rough price for the
above.
Cheers
Jim

Hi Jim,
Around $1200 to $1500 with no autotund in ave cond for the 550. I do not know about the modem. Of course you see no 550s on ebay, when your on a good rig you stick with it.

p.s. Codan man will be sent back this weekend.

Cheers
Wayne

2670. RE: [codan_outback_radio] New file uploaded to codan_outback_radio

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-04-29 06:36:52 UTC
From: Jim
Topic: 7 Message: 2670

Years ago we noticed similar figures using amateur HF whips mounted at the front and back. So for years my autotune was mounted on the front. Several weeks ago I mounted it on the back of the cruiser.
NOW ya tell me :))
I might add that the change was motivated by vehicle insurance.

Cheers
Jim

Jim,

I will have to admit to looking at these Ba(*%$ts a few years ago. They were $2800 retail with the autotune at about the same time that the 9323 was about $3500 retail. My estimation would be about $800 - $1000 without the autotune and about $1200 - $1400 with the auto tune depending upon which version...there were two: the 510 and 910. The 510 was a white colour and the 910 dark blue or dark grey.

They did have one really good feature...absolutely everything the set is capable of is accessible from the programming software... AM, LSB full 2 - 30mHz, front panel programming...etc... I had better pull my head in now for fear of a flame war..!!

Cheers,

Mark

ps I have 2 Codans and no B!@#$%^s !!

Hi Mark, sold a couple of B^^&&&** 250 remotes some time ago. Couldn't find any software to reprogram em. I'm sure its out there (Scully) (!)
I know I'm biased and ignorant about those radios but they just gave me a feeling of being "flimsy". Probably wrong but I've spent anough time in the bush to know that if anything can fall off it will :))
Cheers
Jim

From: Paul
Topic: 2653 Message: 2673

I think form memory you can program them from front panel (the 250), you just need to make a dummy mic plug with the program pins shorted out... I had to do one about 6 years ago. cant remember all the detials.

Jim <jimshire1@...> wrote:Hi Mark, sold a couple of B^^&&&** 250 remotes some time ago. Couldn't find
any software to reprogram em. I'm sure its out there (Scully) (!)
I know I'm biased and ignorant about those radios but they just gave me a
feeling of being "flimsy". Probably wrong but I've spent anough time in the
bush to know that if anything can fall off it will :))
Cheers
Jim

Subject: [codan_outback_radio] Re: O/T What's it worth?

Jim,

I will have to admit to looking at these Ba(*%$ts a few years ago.
They were $2800 retail with the autotune at about the same time that
the 9323 was about $3500 retail. My estimation would be about $800 -
$1000 without the autotune and about $1200 - $1400 with the auto
tune depending upon which version...there were two: the 510 and
910. The 510 was a white colour and the 910 dark blue or dark grey.

They did have one really good feature...absolutely everything the
set is capable of is accessible from the programming software... AM,
LSB full 2 - 30mHz, front panel programming...etc... I had better
pull my head in now for fear of a flame war..!!

Cheers,

Mark

ps I have 2 Codans and no B!@#$%^s !!

2674. Multi tap antenna and Codan 8525

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-04-30 03:02:22 UTC
From: coombesplo
Topic: 2674 Message: 2674

Hi all have just joined this forum after having purchased a Codan 8525 together with Suvivor 16 multi tap. I have had some discussions with Jim prior to my acceptance into this forum so pleased to see a sight with so much info on Codan Radio's. It would appear from what I have seen Codan doesn't offer much by why of any after sales support for older Codan models! I have located a copy of the user manaul for the 8525 but it doesnt really explain the operation of the radio in great detail.

My question to you is about the tuning button on the remote head of my radio. As I have multi tap is this button superfluous or does it actually serve a purpose? My very limited understanding of these radios is that if they are attached to a multi tap you select the channel number on the remote and tap the antenna to match frequencies. I have tried the tuning button and it does its customary beep but does it do anything else?

Also the LSB function button does not appear to work does this mean the radio is not programmed for LSB.

Finally does anyone know someone in Adelaide who may be able to check whether the radio and antenna are matched properly I believe this is called SWR but please correct me if I am mistaken. The actual antenna is mounted on the rear of my vehicle which is a sedan and having just read the post about positioing of antenna's from front to rear I am just thinking two cans attached by a very long piece of string might be a better option.

2675. Re: [codan_outback_radio] Multi tap antenna and Codan 8525

From: Paul
Topic: 2674 Message: 2675

Hi ,

The tune button does perform a function where when it is pressed it will key the transmitter for the time the button is pressed. When you have a tapped whipped it really only serves a purpose when you test the VSWR of the antenna (at the time of installation) You would key the transmitter for a short peroid (10 seconds) to take a meter reading,

The tune button is more relavent when you have the radio connected to a mobile Auto tune antenna or a manual antenna tuner in a base setup. When you press the button the radio will key the transmitter at the same time that it "tunes" the antenna (about 30 sec's on the older Auto tune's).

Also the "LSB" option. The button will only function when the radio is programmed for USB/LSB option on the selected channel, you will also need to have the optional crystal installed for the LSB option , You would really only want the LSB option if you wanted to use the radio on Amatuer frequencies below 10MHz or on private frequencies. All commercial HF freqs including RFDS use USB, hence the radios dont have the optional crystal fitted.

Dont stress to much about antenna positioning at first, with larger HF antennas mechanical stability and trying to mount the antenna in a practical location in the clear is the main critea, yes the higher the better and grounding is very important, you can improve these later on quite easily once you have got a better understanding. the old two cans and string method doesn't always cut the mustard when trying to call for help.

By the way you are correct about the use of the multitap antenna. - nice and simple and reliable.

hope this is of some help.

Thanks for the speedy response Paul. A little knowledge goes a long way and particularly as useful information about each of the functions other than mute, volume, channel etc is reasonably hard to locate and what is included in the operating manuals is not what i would call comphrehensive!

So at this stage I am better informed about the use of the Tune button and the LSB function (for which I will not bother). In terms of antenna I have seen some tapped whips with a stainless tip on top which can obviusly be adjusted. Are these any better than my manual 16 tap?

From: Paul
Topic: 2678 Message: 2681

they are 1/2" whitworth and the guys I have spoken to around $90-120 mark, I have worked the guy who designed them for the club and makes most of the clubs orders last year on the October longweekend
. I have also worked a few VK3's who have used them in the extended outback trips and they seemed to be up to the task.

probably a good back up antenna for the price if you already have an Autotune.

2682. RE: [codan_outback_radio] Whip aerials

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-04-30 05:44:43 UTC
From: Jim
Topic: 2678 Message: 2682

Thanks Paul. I've emailed them but some spam filter rejected me. I suppose if I'd of sent a porno pix it would of gone through !
They sound like a good idea for the cheaper end of the market, I'd like to look into it but as I said, story of my life :))
Cheers
Jim

Subject: RE: [codan_outback_radio] Whip aerials

they are 1/2" whitworth and the guys I have spoken to around $90-120 mark, I have worked the guy who designed them for the club and makes most of the clubs orders last year on the October longweekend
. I have also worked a few VK3's who have used them in the extended outback trips and they seemed to be up to the task.

probably a good back up antenna for the price if you already have an Autotune.
Jim <jimshire1@...> wrote:
What sort of money do they ask Paul. And the mount looks like a normal cb mount ?

2684. RE: [codan_outback_radio] Re: Multi tap antenna and Codan 8525

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-04-30 06:07:27 UTC
From: Jim
Topic: 2674 Message: 2684

Sure is. Used to set the SWR for minimum over a small range of frequencies.
It's particularly useful with amateur operation as just one of their bands
has over 35" channels"....and there are a few bands :))
Cheers
Jim

2685. Re: [codan_outback_radio] Re: Multi tap antenna and Codan 8525

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-04-30 06:20:21 UTC
From: Paul
Topic: 2674 Message: 2685

the tips is just a short length of wire that can be trimmed in length to assist in tuning the antenna, the other advantage is you can replace it if you trim the antenna to short. with a fixed length antenna you cant adjust the length because of the epoxy coating hence it is a fixed length.

Subject: RE: [codan_outback_radio] Whip aerials

they are 1/2" whitworth and the guys I have spoken to around $90-120 mark,
I have worked the guy who designed them for the club and makes most of the
clubs orders last year on the October longweekend
. I have also worked a few VK3's who have used them in the extended
outback trips and they seemed to be up to the task.

probably a good back up antenna for the price if you already have an
Autotune.

2687. RE: [codan_outback_radio] Whip aerials

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-04-30 06:26:42 UTC
From: Jim
Topic: 2678 Message: 2687

True, but you'll notice that they were sold "as is, no returns and I dont wanna know :) I've sold a few before and always supported the sale, hard to do if it sells for $300 and its a days work to refurbish. If you can get the bits....You might pay another 350-400 for a 9350 but in the long run they are a better buy.
People are always asking me where they can buy the basic whip for 737. Now I almost know :))
Cheers
Jim

2688. Re: [codan_outback_radio] Multi tap antenna and Codan 8525

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-04-30 12:05:10 UTC
From: John Jacobs
Topic: 2674 Message: 2688

Hi,

Contrary to opinion in some quarters, Codan has oodles of information available on older radios etc. There is a free CD-Rom entitled Customer Service Support - discontinued products. Its got user guides and technical manuals for the 8525, 8528, 9313, 9323 and the 9105 (X-2).
I'd post my copy on the forum....but its 200Meg! Nothing later than the 8525. You'll have to ask around the group if you need info on 7727s etc.

Cheers

John

coombesplo <coombesplo@...> wrote:
Hi all have just joined this forum after having purchased a Codan 8525 together with Suvivor 16 multi tap. I have had some discussions with Jim prior to my acceptance into this forum so pleased to see a sight with so much info on Codan Radio's. It would appear from what I have seen Codan doesn't offer much by why of any after sales support for older Codan models!

2689. Re: Whip aerials

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-04-30 14:50:15 UTC
From: desertdust
Topic: 2678 Message: 2689

I picked one up a few months ago, all amateur bands and all vks737 cost me $170. I've used it in the bush a fair bit, wacked a few trees and so far so good. Had some good reports into Europe on 20m some bad but hey can't expect too much from a tapped whip.

2690. 2716 EEPROM source ?

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-04-30 22:16:05 UTC
From: Brad Granger
Topic: 2690 Message: 2690

Hi Guys,

I'm looking for an Australian supplier of 2716 eeproms to replace the old ones in a couple of Codan 2202 antenna tuners. Farnell and RS don't stock, but they aren't the be-all and end-all of suppliers.

The unit requires 3 x 2716 or identical equivalents, mods are out of the question.

Can anyone help?
Thanks
Brad VK2QQ

In fact Codan supplies a lot of info to their dealers that we don't hear
about for obvious reasons.
There's no way I'd become a dealer spending hundreds of thousands to work on
Codan gear if they gave all the info to the general public.
When the product is no longer "supported" you may be lucky enough to find
some of this info.

Cheers
Jim

Got a reply,

7 Band whip cost $120-00 ...Has 5 Four Wheel Drive Freq 3.995
5.455 8.002 11.612 14.977 plus 10 Metre Amateur Band 28Meg & 27 Meg
CB Band

Plus shipping.

So I guess that I will also try one. Only want one to use mainly as a
27Mhz CB with VKS as backup for my autotune. Just need to find the
hight 1st.

Cheers
Wayne

Topic: 2708 Message: 2709

Of course you are :)) The eprom.dat files are around 64K, all is well. Tell your mate that he owes you bigtime.
BTW the 27C512 is used in the 28.
Cheers
Jim

Subject: [codan_outback_radio] 8525 EPROMs - '256 or '512?

I currently have a 25A here to program for a mate (aka doing it for nothing). It uses a 27C256 = 32kB. I have several old 8525 eprom image files from yesteryear that are 64kB. Am I going crackers?

Peter

They ALL do - but they'll never pay up of course. First beer they
buy me will be at my wake.

> BTW the 27C512 is used in the 28.

Yep, got a stockpile for them. That also made me a tad suspicious.

BTW, how'd that broadband thing go?

Hey I just program em I'll leave the tech details to others(eproms weren't around when I was a tech...we still used dinosaurs to get to work, ol Fred, Barnie and I :).
Sounds like we have similar mates.
Broadband ? Ah, was it you that I got the aerial off ? Working well thanks .
An overseas list member uses it on his base.

I have the "means" ... even a Mondo ;-)

On the 8528, I obtained ex Cameron/Jock/Angus/? (the guy with the
scots name at Codan) a set of masters so that I don't wind up running
out of EPROM space when a set needs its tenth reprog. If you or
anyone else have masters for a '25 handy that would be appreciated.

Peter

My apologies. I havent looked at the size of a 25 eprom file for a while,
only the 28 ones. But as Ben says, the 25A uses the 256 ,which can be found
in some old puters if anyone is really desperate :))

Cheers
Jim

Thanks for that Ben. So these files I have (64kB) labelled
xxxx25.bin aren't 8525 after all? Weird. Anyway, I've had a sleep
since then and I'm sure to get over it ;-)

Yep, you and Jim are on the ball. They WERE 25B files, so I'm NOT
going bonkers. Gald to get that sorted.

I just got a reply, seems to be the same size as the multiband unit, there is a pdf file one the site that appears to be made on the same blank.

see paste from there email below:

"You can see a picture of the whips we sell on our Web Site http://www.qsl.net/vk3frc and look under projects.."

and

"The length of the whip is 1550 mm and the adjustable tip is 725 mm long..the overhaul length when put together is 2235 mm."

Cheers
Wayne

2724. RE: [codan_outback_radio] Re: Whip aerials

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-05-06 05:32:09 UTC
From: Rogencamp, Philip - Sydney
Topic: 2678 Message: 2724

HI GUYS I JUST GOT A REPLY FROM THE HAM CLUB MAKING THE WHIPS WITH PRICES AND CONTACT DETAILS PLEASE SEE BELOW.

PHIL.

Hi Phillip,
Thanks for your enquiry re our whips ..

(1) 5 Band whip cost $100-00 -------80 - 40 - 20 - 15 - 10 Metre's
(2) 8 ----- ---- ---- $130-00-------80 - 40 - 30 - 20 - 17
- 15 - 12 - 10 Metre's

(3) 13 ----- ---- ----$170-00 ------80 - 40 - 30 - 20 - 17
-15 - 12 - 10 Metre's
+ 5 Four Wheel Drive Freq ... 3.995 - 5.455 - 8.022 - 11.612 -
14.977

The 3 above whips can also be used on the CB Band 27Mhz Band at the
10Metre tapping point without moving the tip ..

(4) 7 Band whip cost $120-00 ...Has the above 5 Four Wheel Drive
Freq +
10 Metre Amateur Band & 27 Meg CB Band ..

We can no longer send these by post they put a stop to it as there to
long..we did get away with it for some time ...

We now are sending them by BUS FREIGHT ..The cost to send & package to
there depot in Berowra Hts will cost you extra $20-00 ..if you wanted to
have it delivered to your address it would cost extra $6-00 but some one
would have to be there to sign for it ...

If you wish to purchase one make out Cheque or Money Order to (FAMPARC
) and send it to my address below ..
Ps..If you wanted to ring me my Ph no is (03) 95845685 the best time to
ring is between 7pm & 8pm ..im home most nights but not tonight the 6th
May..

If you need any more info let me no ..

Regards Allan VK3AB on behalf of our club (FAMPARC
)

I just got a reply, seems to be the same size as the multiband unit, there is a pdf file one the site that appears to be made on the same blank.

see paste from there email below:

"You can see a picture of the whips we sell on our Web Site http://www.qsl.net/vk3frc <http://www.qsl.net/vk3frc> and look under projects.."

and

"The length of the whip is 1550 mm and the adjustable tip is 725 mm long..the overhaul length when put together is 2235 mm."

Cheers
Wayne

2725. RE: autotune not auto tuning [reply to Ben]

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-05-07 07:32:37 UTC
From: Mick Barson
Topic: 2725 Message: 2725

Thanks Ben, turned out to be a damaged antenna coax cable, all tuning OK now.

Cheers
Mick

Message: 1
Date: Fri, 23 Apr 2004 07:34:45 +1000
From: hobson <hobbo@...>
Subject: Re: autotune not auto tuning

Mick
do you get any error message on the radio? Does it fail to tune instantly or
does the antenna seem to tune through its range and then fail. What radio
are you using.

possible causes are
No TX power from the radio
broken control cable or antenna coax
broken/missing whip top from antenna
mechanical failure of the antenna (worm drive coupling is broken)
electronic failure in the antenna (very unlikely)
vehicle is parked under a shed/tree etc

cheers
ben

2736. Hello from The Arkansas Ozarks

Yahoo group: codan_outback_radio (1997 — 2004)
Date: 2004-05-10 16:23:04 UTC
From: John Cook
Topic: 2736 Message: 2736

Hello to the Group,

I just purchase a Canadian gov surplus Codan 8528 to install in my M151A2 military jeep for hf communications while exploring the hill country deep in the Ozarks.I'm an avid amateur radio operator and operate portable and pedestrian mobile often here in the hills with military hf backpack radios while day hiking. In reasearch of different radios on the web I noticed that the Codan radios are very popular with folks who explore OZ in 4X4's and the 8528 seemed like a good choice for a mobile rig for my Jeep.
I have spent an hour or two reading back posts to the group and learned much about the rig.Thanks for the education!

When propigation is good maybe I can work some of you folks mobile to mobile while we are both out exploring.I'll listen in on your net freqs. for band openings.

All the best from the other side of the planet!

John Cook
Fayetteville Arkansas,USA
K6ERO

PS. you can see what I'm up to at www.muttmotorpool.com

Well finally managed to borrow a digital camera to photograph installation. I have previously indicated some concern with how the antenna is mounted so please cast your critical eyes over the pics I have uploaded under Dave's Setup.
I appreciate all comments as I am not sure if the setup I have is optimal or not.

Topic: 2738 Message: 2740

Nice setup Dave, we use much the same setup on a towbar for a lot of our sedans even though we use the codan
9350 antenna. 2 things though.

1. Swing the offset bar over to the passenger side of the rear of the car, yes I know it gets closer to trees on that side
but you are less likely to get a ticket for obstructing your number plate when viewed from the inside lane of a
multi-lane road. Even at work we have to do it and our blokes write the tickets!

2. Look at making a brace up out of slightly lighter bar that looks like a flattened "Z" running from under the lower mount for
the antenna support post you have on the offset bar down and under to the first or second bolt on the swan neck if
fitted. This helps to take sway out of the antenna and preventing the offset bar from bending where it connects at the towball
hole. I know thick metal shouldn't bend, but on some of our corrugated roads up here 15mm plate will bend!

Also if you remove the bumper (Just a plastic cover really!) you will find a grommeted hole large enough to bring the Antenna
connector through instead of the boot lip, not as fast for aesy removal though. On VY commadores this is located just below the
passenger side tail light on the side of the car. On BARRA Fords it is on the drivers side of the boot.

Regards,
Sam

Hey Sam, where's the magic holes to bring cables through on barn door
Landcruisers ?

Cheers
Jim

Nice setup Dave, we use much the same setup on a towbar for a lot of our
sedans even though we use the codan
9350 antenna. 2 things though.

1. Swing the offset bar over to the passenger side of the rear of the
car, yes I know it gets closer to trees on that side
but you are less likely to get a ticket for obstructing your number
plate when viewed from the inside lane of a
multi-lane road. Even at work we have to do it and our blokes write the
tickets!

2. Look at making a brace up out of slightly lighter bar that looks like
a flattened "Z" running from under the lower mount for
the antenna support post you have on the offset bar down and under to
the first or second bolt on the swan neck if
fitted. This helps to take sway out of the antenna and preventing the
offset bar from bending where it connects at the towball
hole. I know thick metal shouldn't bend, but on some of our corrugated
roads up here 15mm plate will bend!

Also if you remove the bumper (Just a plastic cover really!) you will
find a grommeted hole large enough to bring the Antenna
connector through instead of the boot lip, not as fast for aesy removal
though. On VY commadores this is located just below the
